Dipl.-Ing.
Hansjürgen Schäfer
CEO

SCHAEFER is a wholly owned, privately run and assisted by a qualified, and experienced team of experts. SCHAEFER has grown in a controlled and sustainable manner to a dedicated workforce of over 200 people, who oversee the entire concept, design and manufacture of all of the SCHAEFER Product Portfolio. Stemming from more than 40 years experience, SCHAEFER Personnel can tap into a rich resource which can only be gained after detailed and in-depth consultation with Clients.

In his position as CEO, Dipl.-Ing. Hansjürgen Schäfer pursues this approved course of business management of continuously developing client relations and assistance. "Assisting our clients in the field of engineering, product utilization as well as in the area of flexible development of customized power supplies, we are pursuing a sustainable growth strategy. At the same time we are committing ourselves to our headquarter in Germany and are proud of our products "made in Germany"."

SCHAEFER Worldwide Offices

With its headquarters in South-Germany, a production facility in Ireland and sales offices in the USA and UAE as well as numerous representatives, SCHAEFER possesses a comprehensive worldwide sales network.

Furthermore SCHAEFER clients benefit from these engineering skills through an optimized solution tailored, if necessary, to the needs and parameters of their projects which can be equipped with numerous additional options.

“In this context, being client orientated is our main priority. We are pleased to support you to tap the full potential of the SCHAEFER’s product range from 100W to 500kW. With pleasure we also compile for you a customised solution because you come first with us. Our purpose is to offer you high-quality power supplies with proven technology because we appreciate the importance of our products for your application.”

Worldwide network of branch offices & representatives

SCHAEFER is committed to support your needs with the best resources around the world.

Maintaining the ability to design & manufacture in house generates a large degree of flexibility. The SCHAEFER Client profits from these engineering skills through an optimised solution tailored to the needs and parameters of the Project.

Immediate proximity also generates the free flowing information path, which is the production and development area, along with the testing and customer support area being all under the same roof. This enhances the SCHAEFER Teams ability to react to exacting demands with ease. Fruits of this labor are to be seen throughout the world in a variety of fields such as:

- Rail & Transit
- Automotive Industry
- Power Generation Plants
- Oil & Gas Industry
- Chemical Industry
- Industrial Automation
- Military Industry
- Building Security
- Integrated Airport Solutions

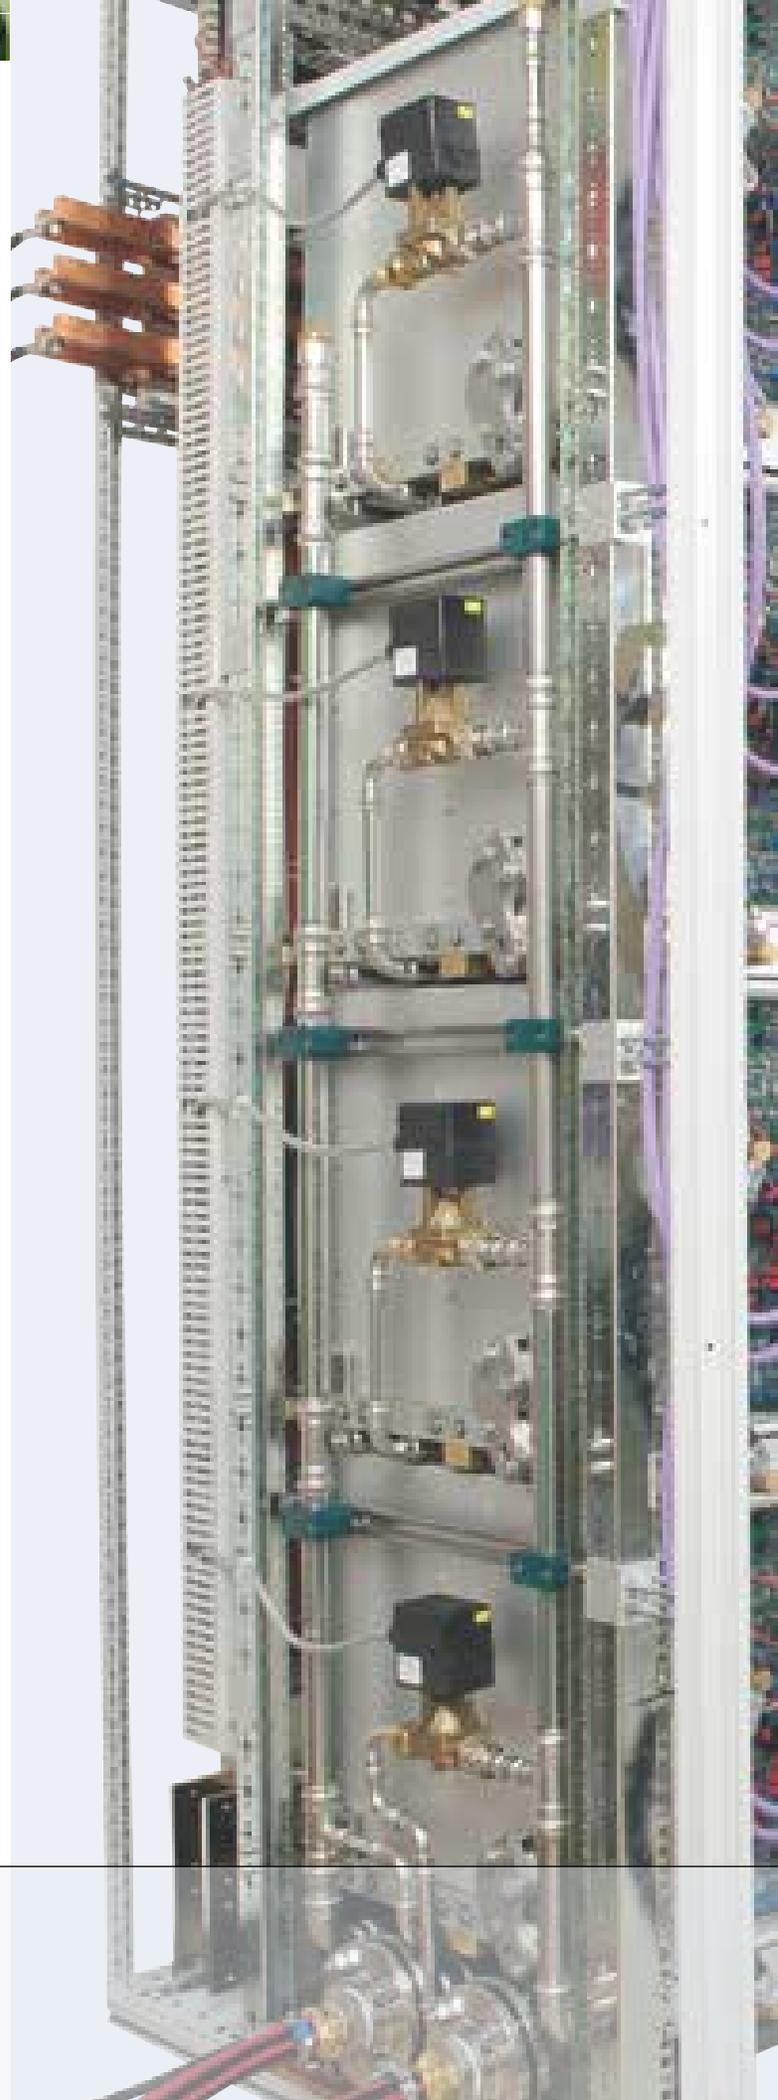

Development guidelines, arduous selection of industrial components regarding their load criteria and temperature performance as well as many test procedures during all steps of production ensure the highest product quality. In addition, Schaefer pursues a full supplier management according to ISO 9001 which guarantees permanent improvement of the products especially within the turbulent market of electronic components.

On demand, SCHAEFER can also provide additional customer specified tests in cooperation with external test laboratories.

Whether on or off shore, stationary or mobile, land, air or marine based, a component or complete system, environmentally Hazardous Area 1, corrosive or simply Industrial, there is a SCHAEFER Power Solution designed to fit the exacting requirements of your next application.

Installation of a 360kW expandable power supply system within a container for mineral exploration on vessel

Container ready for shipment

On board installation

DC / DC Converters, AC / DC Power Supplies & Battery Chargers

- **DC Input voltage:** 10 - 800V DC
- **AC Input voltage:** 115/230V AC, single phase (with or without PFC) or 200/400/480V AC, three phases
- **AC Input frequency:** with PFC 47-65Hz, without PFC 47-400Hz
- **Output voltage:** 5/.../400V DC
- **Output current:** up to 500A
- **Output power:** 100W-7.5kW

Features

- Input / Output isolation
- Continuous short circuit protection
- Overvoltage protection with auto restart
- Operational from - 40 to +75 °C
- Industrial grade components
- Compact and robust design
- Natural convection (except for series C56xx and C57xx)

Specifications

Input

Voltage range	unit switches off at under and overvoltage
No-load input power	5 - 6W typical except for series 4800, 5600/5700
Inrush current	AC input: limited by thermistor
Hold-up time	AC input: 10ms typical @ nom. input voltage (for series 4800: 5ms typical)
Immunity	acc. to EN 61000-6-2

Output

DC output voltages	5	9	12	15	24	36
	48	72	110	200	220	400
Line regulation ($\pm 10\%$)	0.1%					
Load regulation (10-90%)	0.2%					
Load transient (10-90-10%)	6% typical					
Response time to $\pm 1\%$	2-3ms					
Turn-on rise time	Soft-start, 100ms typical					
Ripple	$\leq 1\% + 30\text{mV p-p}$					
Overload protection	current limited to 105-110% of I_{nom}					
Overvoltage protection	OVP switches off module with automatic return to operation					
Remote sense	standard for all series except for B/BP series; up to 10% of U_{nom} for output < 60VDC, up to 6V for output > 60VDC					

General

Efficiency	80 - 92% typical
Operating temperature	-20 to +75 °C (optional: -40 to +75 °C)
Load derating	2.5%/°C above + 55 °C
Storage temperature	-40 to + 85 °C
Cooling (details see page 131)	= natural convection = increased air flow recommended = incl. temperature controlled fans
Humidity	up to 95% RH, non-condensing
Temperature coefficient	0.02%/°C typical
Safety / Construction	acc. to EN 60950-1/EN 50178
Protection category	IP20 acc. to EN 60529, NEMA or others upon request
EMI	acc. to EN 61000-6-4, class A, optionally class B
MTBF	100,000 - 140,000h @ 40 °C acc. to MIL-HDBK-217E (notice 1)
Connectors (details see page 132)	H15 acc. to DIN 41612 and high current connectors for $I > 50\text{A}$, or terminals / bolts / bars

Options (details see page 115)

Input

- Inrush current limiting
- Reverse polarity protection for DC input
- Autoranging for 115/230 VAC input

Output

- Decoupling diode for redundant/parallel operation
- Active current sharing for parallel operation
- Remote on/off (inhibit)

Signals

via relay contacts

- Power ok (input)
- DC ok (output)

Monitoring

of input/output voltage or current via

- analog signal
- interface card RS232 or CAN Bus (external)

Programming

of output voltage or current via

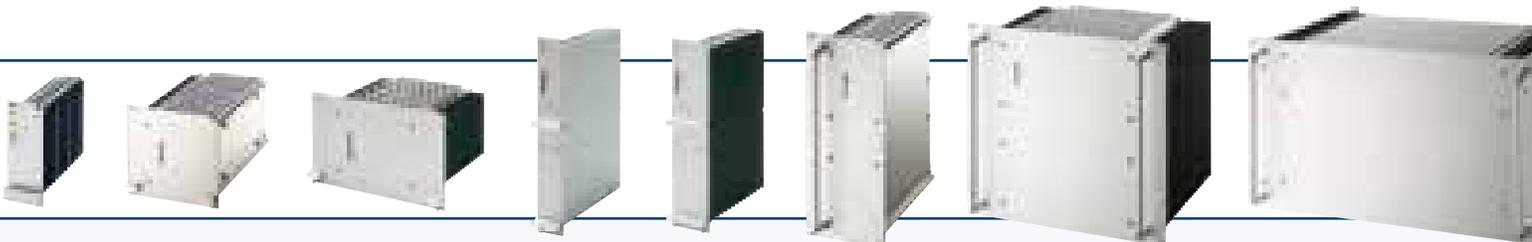

- potentiometer
- analog signal
- interface card RS232 or CAN Bus (external)

Programming of battery chargers

- Temperature compensated charging voltage
- Automatic/manual selection of charging characteristic (external)

Mechanics / environment:

- 19" sub-rack for eurocassette, refer to page 121
- Wall mount
- Chassis mount
- DIN rail mount
- Increased mechanical strength
- Tropical protection
- Extended temperature range to -40°C

Further Information

Order example

Assistance in table use:

- 1 Select the column for input voltage range.
- 2 Select the row for the appropriate output voltage.
- 3 The intersection of both results in the module required.

For example:

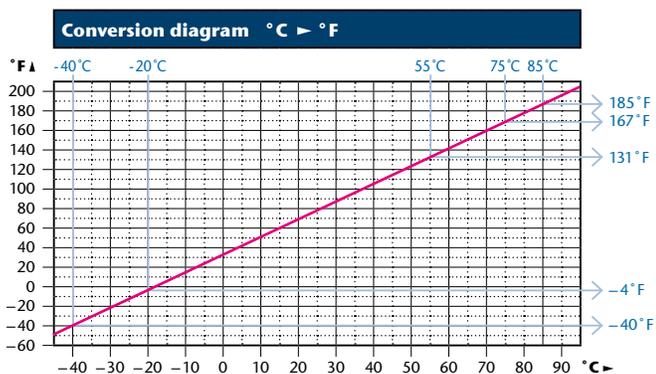

- 1 input voltage = 48VDC
- 2 output voltage = 12VDC @ 12A
- 3 results in a CH 232 module.

Input VDC					Output VDC		
18–36 VDC	36–75 VDC	45–90 VDC	80–160 VDC	160–320 VDC	Output Amps	Adj.	Range

Series specific information

Input

- Protection: by internal fuse
- Switch-on time: 250ms typical
- Power factor correction for CP/BP series acc. to EN 61000-3-2, class D

Output

- Response time to ±1%: 1ms typical
- Remote sense: standard for CH / CP series, up to 10% of U_{nom} for output <40V DC, up to 4V for output >40V DC
- Active current sharing for parallel operation
- Charger control: acc. to IU characteristics
- DC ok signal via open collector

General

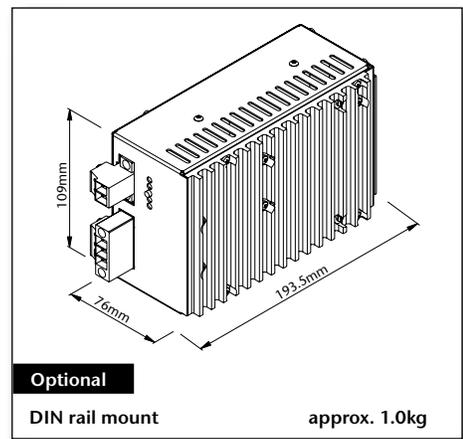

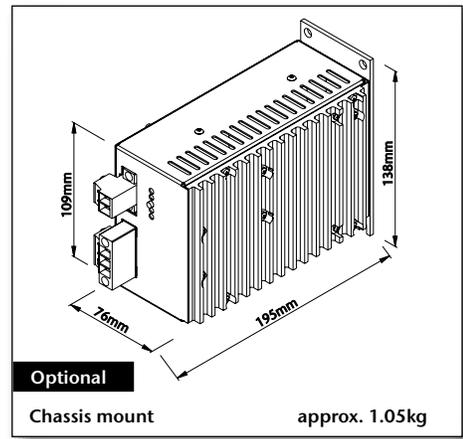

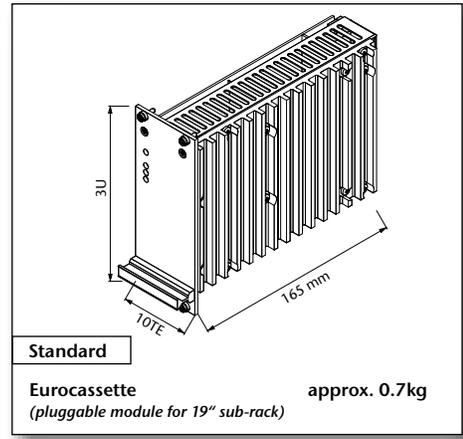

- EMI: acc. to EN 55022, class B

Options

The number of options per module is restricted to input, output and mechanics / environments (see page 10).

Series specific information

Input

- Switch-on time: 1 - 2s
- Power factor correction for CP / BP series, acc. to EN 61000-3-2, class D
- ¹⁾ Input supply from external PFC also suitable

General

- Thermal shutdown with auto restart
- ²⁾ Suited for wall-mount, alternatives upon request

= increased air flow recommended

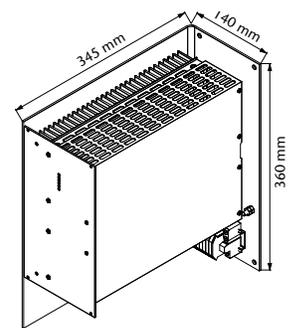

6U

Standard

Eurocassette
(pluggable module for 19" sub-rack)

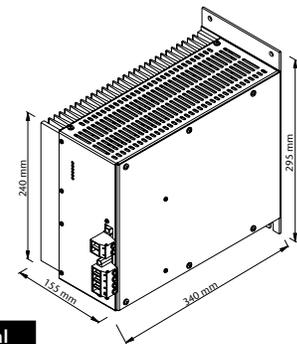

approx. 9.0kg

Optional

Wall mount

approx. 13.0kg

Optional

Chassis mount

(available for currents up to 60Amps)

approx. 10.0kg

Series specific information

Input

- No-load input power: 15W typical
- Switch-on time: 1 - 2s
- Inrush current: 230V AC and 3-phase input: limited by thermistor
- Hold-up time for AC input: 5ms typical @ nominal input voltage

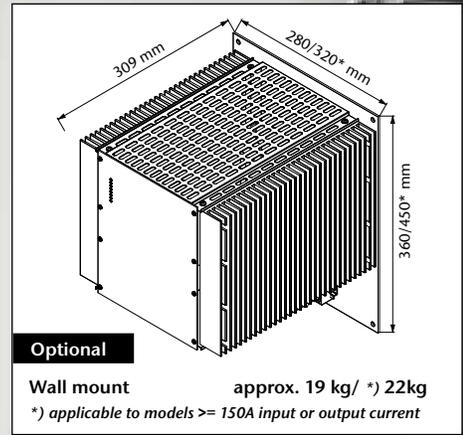

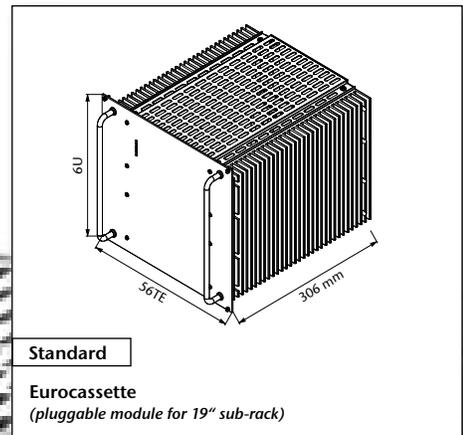

Output

- Response time to ±1%: 5 - 10ms
- Turn-on rise time: Soft-start, 100-300ms typical
- OVP without restart for ZVS

General

- Thermal shutdown with auto restart
- Option "rco" for ZVS-modules available (see p.118)
- ¹⁾ Input supply from PFC also suitable
- ²⁾ Suited for wall-mount, alternatives upon request
- = increased air flow recommended

Step-up converters

The step-up converters are very similar to the DC/DC converters of series "C", except that the step-up converters sense the voltage across the load which is the total of the battery voltage and the voltage added by the step-up converter. The step-up converter can not reduce the voltage being applied to its input. Therefore, the load should be specified for the maximum battery voltage.

For output voltage stabilization

The output voltage of an e.g. battery charger with parallel connected battery varies substantially with the charging condition of the battery. For many applications, however, the load circuit requires a better stabilized voltage. Frequently used methods for reducing the voltage variation are e.g. "voltage dropping diodes". A more economical solution is given by switch mode step-up converters. These are DC/DC converters supplied from the battery with the output connected in series to the battery. Due to the circuit configuration, the output of a step-up converter is not isolated from the input supply (battery).

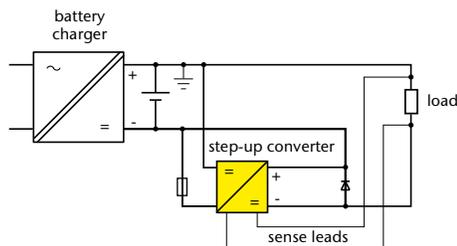

Circuit diagrams

Step-up converter with common positive line

standard version

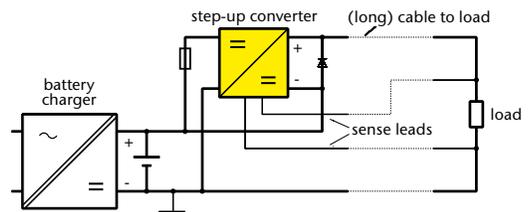

The following circuit diagram shows a step-up converter which can be grounded on the positive side. The voltage will be added at the negative side and the positive line is common for input and output.

Step-up converter with common negative line

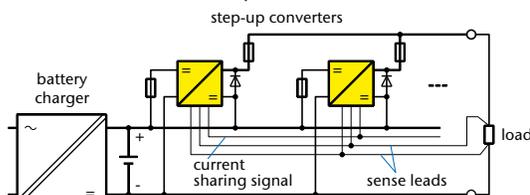

optional version

The following circuit diagram shows a step-up converter which can be grounded on the negative side. The voltage will be added at the positive side and the negative line is common for input and output.

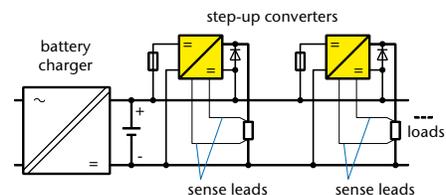

Parallel operation of step-up converters

For more power or redundancy step-up converters may be connected in parallel with active current sharing, individually protected by fuses at the input and decoupling diodes or fuses at the output. Such systems have already been realized for 2,000 Amps.

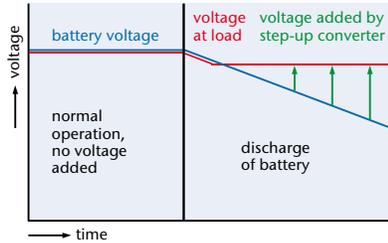

Individual load supply

For applications that require individually stabilized voltages across the loads, the step-converters will be connected as shown in the following diagram and may be of different power ratings.

Operation diagram

- During normal operation no voltage needs to be added and the converter runs with a minimum of power losses. The voltage at the load is slightly reduced as the current flows through the bypass diode. The bypass diode also allows for replacement of the step-up converter and should therefore be installed externally.
- During battery discharge the converter adds the voltage that is needed to maintain the required output voltage level.
- The maximum voltage to be added is normally less than 20% of the total voltage. Therefore, the step-up converter needs to be designed for 20% of the through-power, only.

Example:

- Input: 40 – 56VDC (battery)
- Output: 0 – 10VDC (step-up voltage)
output voltage regulated to 50V during discharge of battery

Create your step-up converter

Each DC/DC converter can be modified to be a step-up converter:

- calculate the output power of the step-up converter: max. voltage to be added x max. load current
- choose the suitable "C" series
- re-name the model as "E" ...

DC / DC Converters, AC / DC Power Supplies & Battery Chargers

- **DC Input voltage:** from 80 - 800VDC
- **AC Input voltage:** 115 / 230VAC, single phase or 200/400/480VAC, three phases
- **AC Input frequency:** 47-400Hz
- **Output voltage:** 5/.../800VDC
- **Output current:** up to 800A
- **Output power:** 5 - 40kW

Features

- Input / Output isolation
- Continuous short circuit protection
- Overvoltage protection
- Thermal shutdown with auto-restart
- Operational from - 40 to +75 °C
- Industrial grade components
- High efficiency through ZVS topology
- High power density
- Compact and robust design
- Fan or liquid cooled

Specifications

Input

Voltage range	narrowing of input voltage range optimizes the efficiency (pls. specify); unit switches off at under- and overvoltage
No-load input power	30W typical
Switch-on time	<1s typical
Inrush current	3-phase AC input: limited by thermistor (except for series 55xx, 64xx, 66xx, 67xx & CW/BW56xx)
Immunity	acc. to EN 61000-6-2

Output

DC output voltages	5	9	12	15	24	36	48
	72	110	200	220	400	600	800
Output power	from 5 to 40kW						
Line regulation ($\pm 10\%$)	0.1%						
Load regulation (10-90%)	0.2%						
Load transient (10-90-10%)	6% typical						
Response time to $\pm 1\%$	10ms typical						
Turn-on rise time	Soft-start, 300ms typical						
Ripple	$\leq 1\% + 30\text{mV p-p}$						
Overload protection	current limited to 105-110% of I_{nom}						
Overvoltage protection	OVP switches off module with automatic return to operation; after 5 seconds, the unit will remain latched off						

Remote sense	standard for all series up to 150V output, except for battery chargers; up to 10% of U_{nom} for output < 60 VDC, up to 6V for output > 60VDC
--------------	--

General

Efficiency	80-95% typical
Operating temperature	-20 to +75 °C optional: -40 to +75 °C
Load derating	2.5%/°C above + 55 °C
Storage temperature	-40 to + 85 °C
Cooling	☼ = fan cooled ☼ = liquid cooled (details see page 131)
Humidity	up to 95% RH, non-condensing
Temperature coefficient	0.02%/°C typical
Safety / Construction	acc. to EN 60950-1/EN 50178
Protection category	IP20 acc. to EN 60529, (built-in module) NEMA or others upon request
EMI	acc. to EN 61000-6-4, class A, optionally class B
MTBF	approx. 70,000h @ 40 °C acc. to MIL - HDBK - 217E (notice 1)
Connectors	terminals / bolts / bars (details see page 132) or CombiTacs for Series 5100

Options (details see page I15)

Input

- Inrush current limiting
- Reverse polarity protection for DC input

Output

- Decoupling diode for redundant / parallel operation
- Active current sharing for parallel operation
- Remote on / off (inhibit)
- Reducing of current limiting at high ambient temperature

Signals

via relay contacts

- Power ok (input)
- DC ok (output)

Monitoring

of input / output voltage or current via

- analog signal
- interface card RS232 or CAN Bus

Programming

of output voltage or current via

- potentiometer
- analog signal
- interface card RS232 or CAN Bus

Programming of battery chargers

- Temperature compensated charging voltage
- Automatic / manual selection of charging characteristic

Mechanics / environment:

- Wall mount
- Digital or analog V and A meter
- Increased mechanical strength
- Tropical protection
- Extended temperature range to -40°C

Further Information

Order example

Assistance in table use:

- 1 Select the column for input voltage range.
- 2 Select the row for the appropriate output voltage.
- 3 The intersection of both results in the module required.

For example:

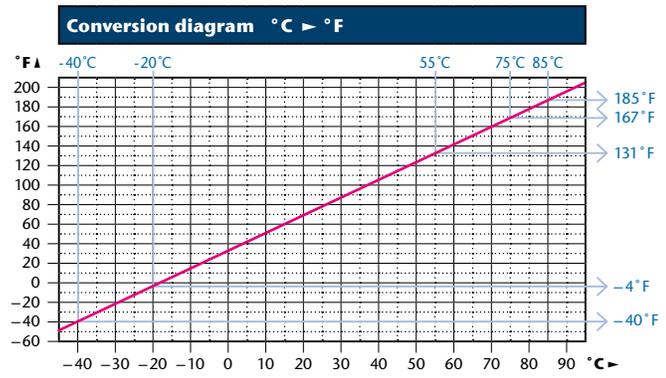

- 1 input voltage = 160 - 320VDC
- 2 output voltage = 60VDC @ 110A
- 3 results in a C 5376 module.

Conversion table

Height:	1U = 44.45mm
	1U = 1.75"
Width:	1TE = 5.08mm
	1TE = 0.2"
	1" = 25.4mm
	19" = 483mm
Weight:	1kg = 2.2lbs

Series specific information

Input

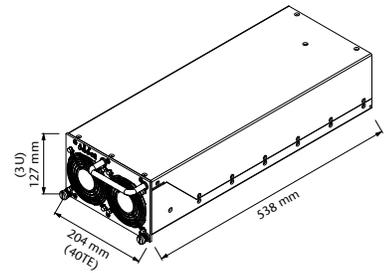

- Hold-up time for AC input: 5ms typical @ nom. input voltage

¹⁾ input supply from PFC also suitable

General

- optional: Cooling via speed-controlled fans (depending on temperature)
 - optional: 19" sub-rack (3U or 5U) with terminals/bolts/bars
- ❄ = incl. fans

5U

Standard

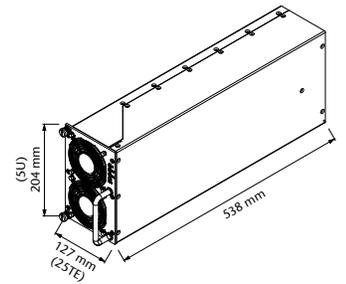

Pluggable module
(for 3U sub-rack)

approx. 17kg

Optional

3U, 19" sub-rack with 2 modules

Standard

Pluggable module
(for 5U sub-rack)

approx. 17kg

Optional

5U, 19" sub-rack with 3 modules

Series specific information

Input

- Inrush current for 230VAC and 3-phase input: limited by thermistor
- Hold-up time for AC input: 5ms typical @ nom. input voltage

General

- ¹⁾ input supply from PFC also suitable
- ☼ = incl. temperature controlled fans

Step-up converters

The step-up converters are very similar to the DC/DC converters of series "C", except that the step-up converters sense the voltage across the load which is the total of the battery voltage and the voltage added by the step-up converter. The step-up converter can not reduce the voltage being applied to its input. Therefore, the load should be specified for the maximum battery voltage.

For output voltage stabilization

The output voltage of an e.g. battery charger with parallel connected battery varies substantially with the charging condition of the battery. For many applications, however, the load circuit requires a better stabilized voltage. Frequently used methods for reducing the voltage variation are e.g. "voltage dropping diodes". A more economical solution is given by switch mode step-up converters. These are DC/DC converters supplied from the battery with the output connected in series to the battery. Due to the circuit configuration, the output of a step-up converter is not isolated from the input supply (battery).

Circuit diagrams

Step-up converter with common positive line

standard version

The following circuit diagram shows a step-up converter which can be grounded on the positive side. The voltage will be added at the negative side and the positive line is common for input and output.

Step-up converter with common negative line

optional version

The following circuit diagram shows a step-up converter which can be grounded on the negative side. The voltage will be added at the positive side and the negative line is common for input and output.

Parallel operation of step-up converters

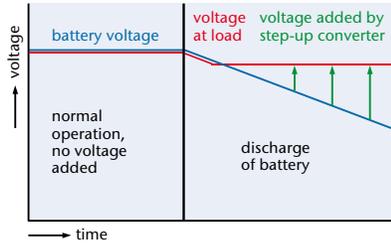

For more power or redundancy step-up converters may be connected in parallel with active current sharing, individually protected by fuses at the input and decoupling diodes or fuses at the output. Such systems have already been realized for 2,000 Amps.

Individual load supply

For applications that require individually stabilized voltages across the loads, the step-converters will be connected as shown in the following diagram and may be of different power ratings.

Operation diagram

- During normal operation no voltage needs to be added and the converter runs with a minimum of power losses. The voltage at the load is slightly reduced as the current flows through the bypass diode. The bypass diode also allows for replacement of the step-up converter and should therefore be installed externally.
- During battery discharge the converter adds the voltage that is needed to maintain the required output voltage level.
- The maximum voltage to be added is normally less than 20% of the total voltage. Therefore, the step-up converter needs to be designed for 20% of the through-power, only.

Example:

- Input: 40 – 56VDC (battery)
- Output: 0 – 10VDC (step-up voltage)
output voltage regulated to 50V during discharge of battery

Create your step-up converter

Each DC/DC converter can be modified to be a step-up converter:

- calculate the output power of the step-up converter: max. voltage to be added x max. load current
- choose the suitable "C" series & re-name the model as "E" ...

DC/AC Inverters, AC/AC Frequency Converters & Static Switches

- **Input voltage:** 10 - 800VDC or 115/230VAC, single phase, 47-400Hz or 200/400/480VAC, three phase, 47-400Hz
- **Output voltage:** 115/230VAC, single phase or 200/400/480VAC, three phases
- **Output frequency:** 50/60/400/800Hz (crystal stabilized) or programmable within 40-400Hz or 400-800Hz
- **Output power:** 200VA-45kVA

Features

- Pure Sine Wave
- Continuous short circuit protection
- Thermal shutdown with auto-restart for
1-phase inverters >1.2kVA
3-phase inverters >3.6kVA
- Suitable for complex load
- Surge power capability
- Industrial grade components
- Compact and robust design
- **3-phase output:** Unsymmetrical load permissible, modular system with interchangeable inverters

**Specifications****Input**

Voltage range	unit switches off at under- and overvoltage
No-load input power	10 – 30W
Inrush current	for AC input and DC input >160V: limited by thermistor
Hold-up time	AC input: 10ms typical Series CI: 20ms typical
Immunity	acc. to EN 61000-6-2

General

Efficiency	80 – 92%		
Operating temperature	– 20 to + 75 °C optional: -40 to +75 °C		
Load derating	2.5%/°C above + 55 °C		
Storage temperature	-40 to + 85 °C		
Cooling (details see page 131)	= natural convection = incl. temperature controlled fans		
Humidity	up to 95% RH, non-condensing		
Safety / Construction	acc. to EN 60950-1/EN 50178		
Protection category	IP20 acc. to EN 60529, NEMA or others upon request		
EMI	acc. to EN 61000-6-4, class A, optionally class B		
MTBF @40°C acc. to MIL -HDBK-217E (notice1)	series IT: 120,000h	series CI: 70,000h	series IV: 50,000h

Output

Output voltages	115VAC	230VAC
	3x200VAC	3x400VAC 3x480VAC
	others available upon request	
Output power	from 200 VA up to 45kVA	
Line regulation (±10%)	0.1% for series CI, 2% for series IT and IV 3% for series IT and IV @ 400Hz	
Load regulation (10-90%)	1% typical, 3% max. (400 Hz: 3% typical, 5% max.)	
Turn-on rise time	soft-start, 100ms typical	
Waveform	sine wave or any wave shape programmable by external signal	
Frequency	40 – 800Hz: adjustable or programmable or any fixed frequency (crystal stabilized)	
Distortion	3% typical, 5% @ 400Hz, 7% @ 40 – 400Hz, 800Hz	
Overload protection (steady state)	current limited to approximately 1.05 x nominal current	
Surge power	2 x nominal power for 1s	
Short circuit protection	electronically limited to 3 x nominal current, unit switches off after 1s	
Crest factor	approx. 3	
Power factor	cos phi = 0.7 inductive/capacitive	

Options (details see page 115)

Input

- Inrush current limiting for DC input
- Reverse polarity protection for DC input
- Autoranging for 115/230VAC input
- Special circuit for 16.6Hz AC input

Output

- Remote on/off (inhibit)
- Static Switch (details see page 97)
- Parallel operation for redundancy or increased power: series IT5xxx

Signals

via relay contacts

- Power ok (input)
- AC ok (output)

Monitoring

of input/output voltage, current or frequency via

- analog signal
- interface card RS232 or CAN Bus (external)

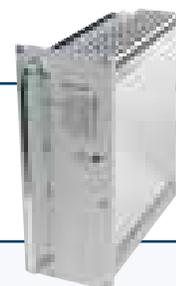

Programming

of output voltage, current or frequency via

- potentiometer
- analog signal
- interface card RS232 or CAN Bus (external)

Mechanics / environment:

- 19" sub-rack for eurocassette, refer to page 121
- Wall mount
- Increased mechanical strength
- Tropical protection
- Extended temperature range to -40°C
- Temperature controlled fans for 19" units

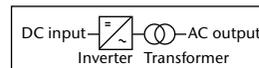

Series IT - Inverters with 1-phase output

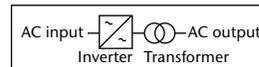

▶ from 200 VA to 15 kVA

Page 89**DC/AC Inverters**

is a combination of a switch mode **Inverter** and a **Transformer** at the output. The transformer provides the isolation between input and output and transforms the voltage to the required level.

**AC/AC Frequency Converters**

is a combination of a switch mode **Inverter** with a rectifier at the input and a **Transformer** at the output. The transformer provides the isolation between input and output and transforms the voltage to the required level.

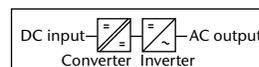

For lower input voltages the CI version is more compact than the IT version.

Series CI - Inverters with 1-phase output

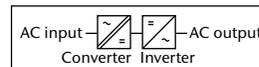

▶ from 400 VA to 3.5 kVA

Page 91**DC/AC Inverters**

is a combination of a switch mode **Converter** and **Inverter**. The converter provides the isolation between input and output and transforms the voltage to the level needed by the inverter for supplying the specified AC output voltage.

**AC/AC Frequency Converters**

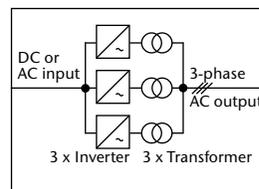

is a combination of a switch mode **Converter** and **Inverter**. The converter provides the isolation between input and output and transforms the voltage to the level needed by the inverter for supplying the specified AC output voltage.

**Series IV - Inverters with 3-phase output**

▶ from 600VA to 45 kVA

Page 93**DC/AC or AC/AC**

is a combination of 3 individual switch mode inverters with output transformers synchronized for a symmetrical 3-phase output. The transformers provide the isolation between input and output and transform the voltages to the required levels.

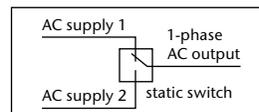

**Series SS**

▶ from 800 VA to 10 kVA

Page 97**Static Switches**

The Static Switch has two inputs for load supply, a priority and a non-priority input, and synchronizes the frequency of one supply to the other. Typically, but not exclusively, supplied by Mains & an Inverter, there are 3 modes of operation:

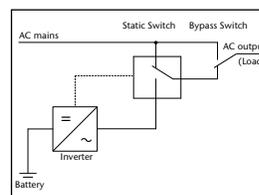

1. Service mode Mains - mains is selected as the load provider.
2. Service mode Inverter - inverter is selected as the load provider.
3. Automated function with priority selection.

**Series U**

▶ from 1 to 2.5 kVA

Page 99**UPS Systems with Static Switch**

provides uninterrupted AC power to a critical load by connecting the load to AC supply 1 which can be the inverter output or to AC supply 2 which can be the mains. Series U does not include the batteries. The batteries can be specified and both, batteries and charger can be added to the system.

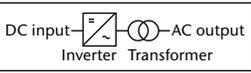

**Connectors**

▶ for Series CI, IT, IV & SS

.6	60Hz
.8	800Hz

= natural convection

Series specific information

Function

The Static Switch has two inputs for load supply, a priority and a non-priority input, and synchronizes the frequency of one supply to the other. Typically, but not exclusively, supplied by Mains and an Inverter, there are 3 modes of operation:

1. Service mode Mains - mains is selected as the load provider.
2. Service mode Inverter - inverter is selected as the load provider.
3. Automated function with priority selection.

In the automated function the supply of the priority input is connected to the load. If the static switch detects deviation from tolerance through monitoring, it will transfer the load to the non-priority input. When the supply of the priority input has returned to be within parameters of voltage and frequency, the static switch reverses this selection.

For adapting the static switch to different requirements, the priority for mains or inverter operation can be selected externally via an opto-coupler. The static switch can also be inhibited via another opto-coupler for disconnecting the load. LEDs and potential-free relay contacts indicate the mode of operation and / or the status of alarms.

Series specific information

Function

The UPS provides uninterrupted power to a critical load, being supplied either by mains or by batteries via the internal inverter.

In the automated function the supply of the priority input (mains) is connected to the load. If the internal static switch detects deviation from tolerance, it will transfer the load to the non-priority input (inverter). When the supply of the priority input has returned to be within parameters of voltage and frequency, the static switch reverses this selection.

For adapting the UPS to different requirements, the priority for mains or inverter operation can be selected externally via switch on the rear side of the UPS. The UPS can also be inhibited either via opto-coupler or via external relay contact for disconnecting the load. LEDs indicate the mode of operation and / or the status of alarms. A potential-free relay contact is given for common alarm.

Optionally, a manual bypass switch can be provided for connecting the load directly to the mains while disconnecting the UPS or the batteries in case of maintenance. For maximum flexibility the batteries (external) can be specified according to the requirements on site and a suitable battery charger (external) can be chosen from the Schaefer product range.

Input / Output

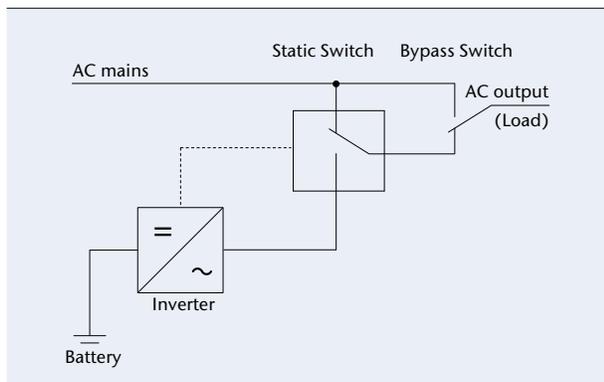

Transfer time	
- mains to inverter (mains priority) or inverter to mains (inverter priority)	≤ ½ period, typically ¼ period (including failure detection time)
- return to mains (mains priority) or return to inverter (inverter priority)	practically no interruption
Transfer trigger	$0.8 \times U_{nom} < \text{voltage} < 1.15 \times U_{nom}$

Power Balance Series

Features

- Modular system 60A to 300A parallelable
- Harmonic compensation for 3-wire and 4-wire technology
- Up to 50th harmonic each individually selectable
- Ultrafast reactive power compensation
- Flicker compensation
- Load balancing between phases and unload neutral wire
- Grid resonancy detection
- Ethernet and Ethercat system for interconnection
- Subsystems Display control unit, Active sensor unit, ModBus, PQ Analyzer ...

General Information

The PB-SERIES is an active harmonic filter system for tower buildings as well as automation, windturbine and various other industrial applications eliminating harmonic oscillations and consequently costs for reactive energy. The filter monitors the current signal & compen-

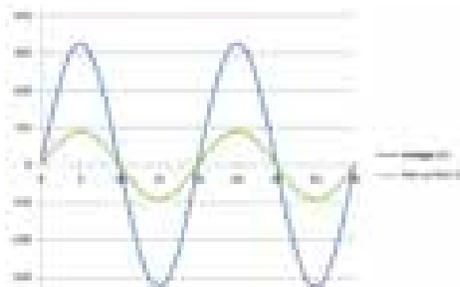

sates for the unwanted elements of the measured current. Thus, the filter ensures a harmonic suppression independently of the number of loads. Furthermore the filter corrects the power factor, improving the systems' efficiency while reducing harmonic pollution.

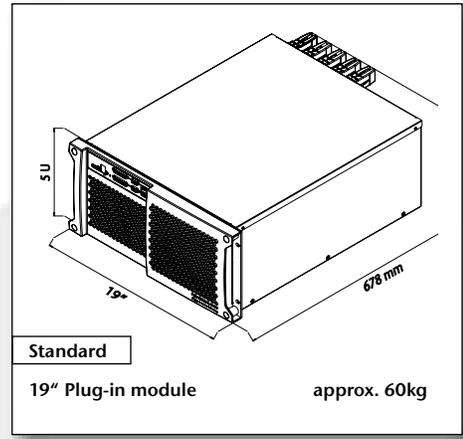

PB Active Harmonic Filter

▪ Without POWER BALANCE:
Harmonic disturbances caused by e.g. non-linear loads.

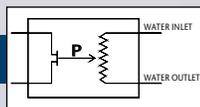

▪ With POWER BALANCE:
Reactive power & harmonic oscillations are actively compensated.

5U

LW 5100 Series

Features

- Regulation of voltage, current, power and resistance
- Wide operating range up to 400V / up to 750A with one module
- Paralleling of up to 4 modules for higher load capacity
- Reduced water consumption depending on load power and water inlet temperature
- CAN Bus interface for control and monitoring
- Protected against thermal overheating
- Determination of the capacity of batteries in Ah (battery tester) / "In service" test of batteries considering actual load currents by an additional current probe input
- Programmable switch off limits to avoid total discharge of the battery

Specifications

Input

Voltage range	12 ... 400VDC
Load current	1 ... 750A
Load power	max. 10kW
Auxiliary input voltage	100-240V AC/ 2A, 50/60Hz
Master-Slave configuration	Expandable up to 40kW
Interface	CAN Bus

General

Operating temperature	0... +50°C optional: -20 to +50°C
Cooling liquid temperature	up to +35°C
Cooling liquid pressure	up to 6 bar
Cooling liquid flow rate	Depending on load power and cooling liquid temperature at the liquid inlet, up to 30l/min
Storage temperature	-20 to +70°C optional: -30 to +80°C
Humidity	up to 95% RH, non-condensing
Safety / Construction	acc. to EN 60950-1 / EN 50178
Protection category	IP20 acc. to EN 60529
Connectors	terminal, bolts, bars

Options

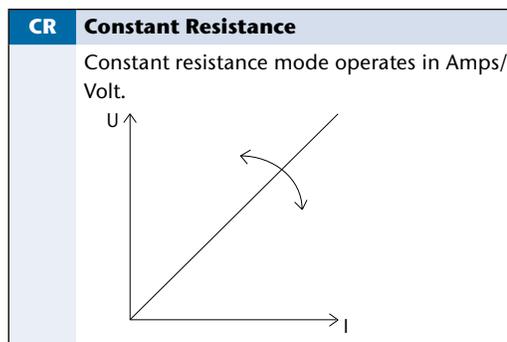

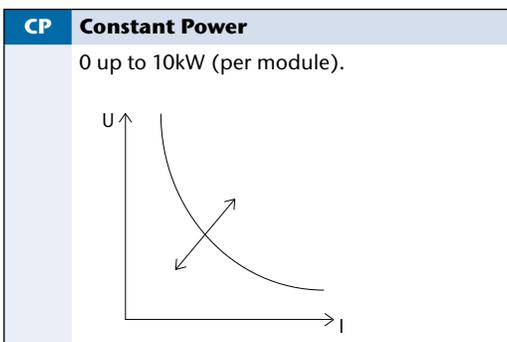

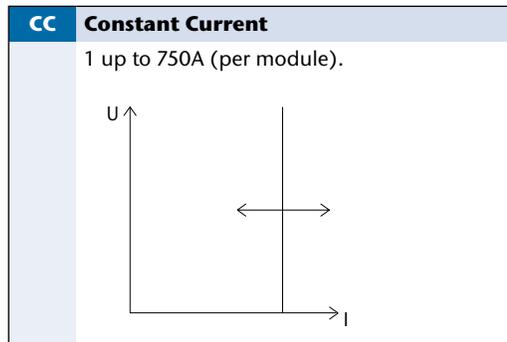

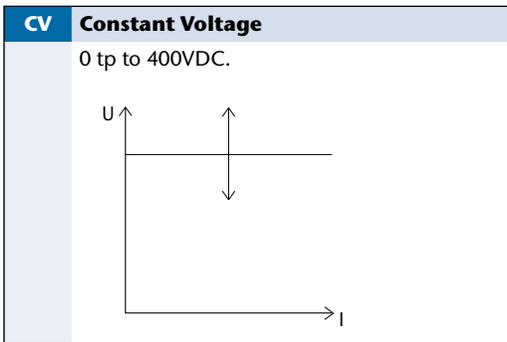

- remote control unit
- extended temperature range

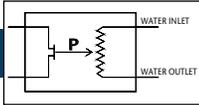

Control

Regulation	Constant voltage (CV), constant current (CC), constant resistance (CR), constant power (CP)
Adjustment / Control	- CV, CC, CR, CP programmable by potentiometers on the front plate, external control unit (remote control) and CAN - Inhibit selectable by push-button on the front plate, external control unit (remote control) and CAN
Modulation	Modulation of voltage, current, power by using internally stored waveforms. Offset, amplitude and frequency adjustable.
Display	Indication of actual values like voltage, current, resistance, power, temperature; status by LCD display
Monitoring	Monitoring of actual values like voltage, current and power by 0...10V, 4...20mA or 0...20mA signal and CAN
Control of external linear valves for liquid cooling	0...10V / 10mA max.
Parallel operation	Power increase by paralleling up to 4 units (40kW)

General Information

This liquid cooled load allows a wide range of operation up to 400V/750A. The small size provides high power density combined with ease of use. Wherever heat and noise of fans is unacceptable, this load offers a perfect solution, e.g. laboratory or test rooms. Due to its capability to connect modules in parallel, the power rating can be increased up to 40kW, controllable by one interface.

3U

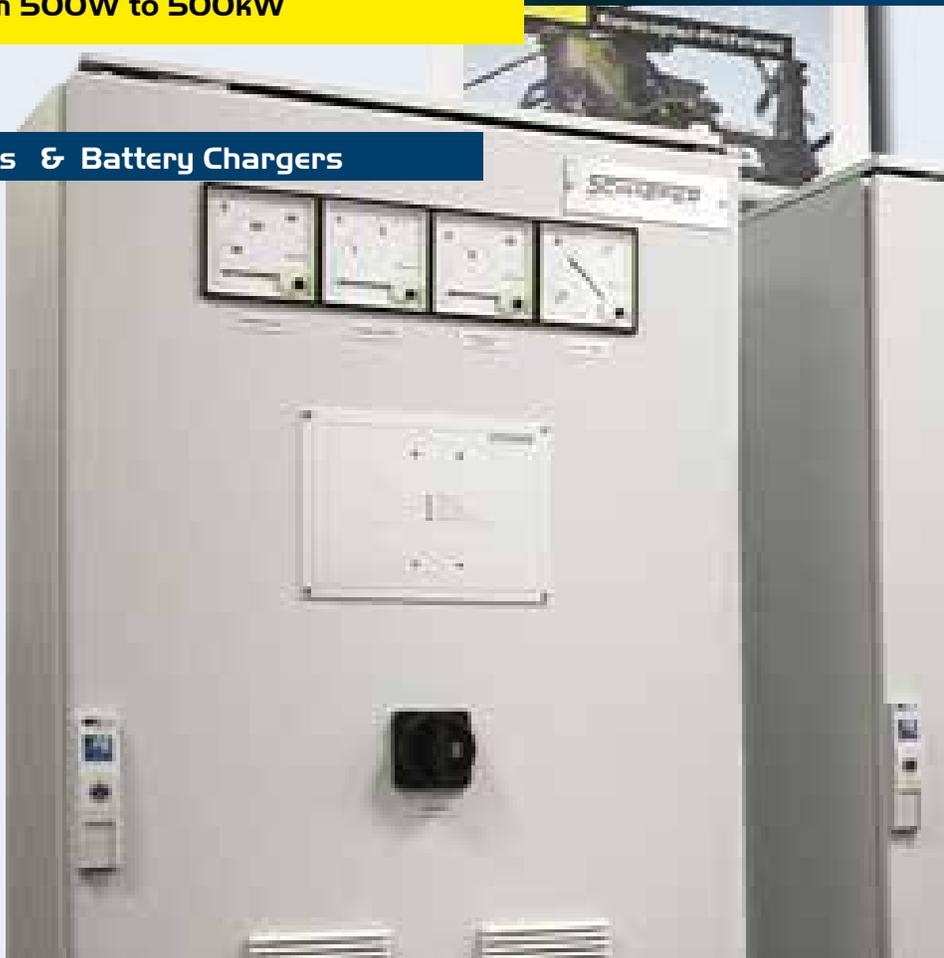

AC / DC Power Supplies & Battery Chargers

- **AC input voltage:**
115/230V AC, single phase, 50 / 60Hz
or 200/400/480/690VAC, 3-phase, 50/60Hz
- **Output voltage:** 12/24/48/60/72/
110/220/360V
- **Output current:** up to 3250A
- **Output power:** 500W - 500kW

Features

- Robust design
- High reliability
- 6-pulse performance
- Optional: 10% input current distortion for 12-pulse charger
- Turn Key solution
- Constant current & voltage operation
- Industrial grade components
- High level of humidity protection
- Concise & clear indication panel

Specifications

Input

Voltage range	nominal voltage $\pm 10\%$ (other voltage upon request)
Frequency	50 or 60Hz $\pm 5\%$
Protection	by fuse

General

Efficiency	
- Series QE	80 – 90%
- Series QD	82 – 92% for models <48VDC 85 – 95% for models ≥ 48 VDC
Operating temperature	-10 to +40°C, optional up to +65°C
Humidity	up to 95 % RH, non-condensing
Altitude	up to 1000m asl
Cooling	natural convection or internal fans
Audible noise	50-70dB (A) depending on power
Safety / Construction	acc. to EN 60950-1 / EN 50178
EMI	acc. to EN 61000-6-4, class A
Enclosure	
- Protection category	IP20 acc. to EN 60529, optional up to IP55
- Color	RAL7035, others upon request
Transformer	acc. to IEC 76 / IEC14 / EN 60591 / DIN VDE 0532

Output

Voltage	adjustable from 90 – 120% of U_{nom} (other voltages upon request)
Line regulation ($\pm 10\%$)	$\pm 0.5\%$
Load regulation (10-90%)	$\pm 1\%$
Dynamic load (10-90-10%)	$\pm 10\%$ typical
Ripple	$\leq 5\%$ rms without battery, optional: < 2% rms or 2mV frequency weighted
Current	electronic current limitation adjustable from 60 – 105% of I_{nom}
Overload protection	short circuit protected by fuse and electronic current limitation
Charging characteristic	IU acc. to DIN 41773 for Pb batteries DIN 41774 for NiCd batteries
Charging voltage	
- float	2.23 – 2.27V/ cell for Pb batteries / 1.4V / cell for NiCd batteries
- equalize	2.35 – 2.4V / cell for Pb batteries / 1.55V / cell for NiCd batteries
- boost (manual activated)	2.7V / cell for Pb batteries / 1.7V 7 cell for NiCd batteries

Options

Input

- MCB, MCCB or isolator
- inrush current limiting
- 690VAC input

Output

- parallel or redundant operation
- 12-pulse performance
- filtering up to 0.1% pp (corresponding to 0.035% rms) or 2mV frequency weighted
- voltage stabilization

Control *(details see page 123)*

IU characteristic acc. to DIN 41773 and 41774

- manual selection of charging characteristic (float / equalize / boost)
- automatic selection of charging characteristic with timer
- temperature compensated charging voltage

Battery

- MCB, MCCB or isolator
- deep discharge protection

Monitoring *(details see page 123)*

analogue or micro-processor-controlled

- input/ output voltage
- battery circuit
- ground insulation failure
- over temperature

Interface Card

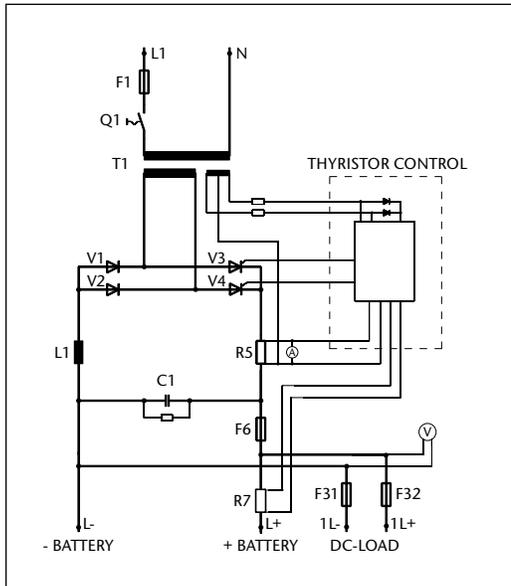

- CAN Bus
- MOD Bus

Mechanics / environment:

- enclosures, IP20 up to IP55, for charger and / or batteries
- analogue or digital meters
- operating temperature up to +65°C
- tropical protection
- earthquake-proof
- vermin-proof

Converters / Inverters

- switchmode DC/DC converters from 100W to 40kW
- switchmode DC/AC inverters, frequency converters and static switches from 200VA to 45kVA

Schaefer offers the industry's most complete range of input and output voltages, combined with a selection of package style, mounting solutions, options for input and output as well as various possibilities of programming & monitoring.

Configuration of model designation:

Add the designation of options to the type number of the power supply module:

e.g. C 3674-**w-dr-eu1**.

Input

<p>i</p>	<p>inrush current limiting</p> <p>A thermistor is connected in series with the input lines which changes its resistance from high to low when it gets hot. It does not reduce the surge current if the input power is interrupted for a short period of time not allowing the thermistor to cool down. Thermistors are fitted as standard to all mains input models except for 1-phase input of models > 2.5 kW. Thermistors are available up to 45A. For higher input current an electronic inrush current limitation can be offered.</p>	
<p>ie</p>	<p>electronic inrush current limiting</p> <p>An electronic circuit limits the high inrush current caused by built-in capacitors. Switch-on time may increase to 5s. This is realized by a series pass transistor or depending on the input voltage by thyristor softstart.</p>	
<p>sd</p>	<p>reverse polarity protection for DC input by series diode</p> <p>A series diode protects the module against DC input voltage of wrong polarity. However, this also causes extra losses and reduces the overall efficiency. calculation formula: $I_{Diode} = 2 \times P_{out max} / U_{in min}$</p>	

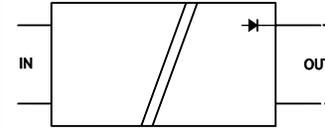

<p>ad</p>	<p>reverse polarity protection for DC input by anti parallel diode</p> <p>To avoid the power losses a diode is provided with opposite polarity in parallel to the input blowing an internal or external fuse if the module is connected to a supply of wrong polarity.</p> <p>calculation formula: $I_{Diode} = 2 \times P_{out\ max} / U_{in\ min}$</p>	
<p>au</p>	<p>auto-ranging</p> <p>For standard dual AC input models the range of 115/230VAC is to be selected by connecting the input line to different pins on the connector. With auto-ranging the unit senses the input voltage and provides the correct connection automatically.</p>	

Output

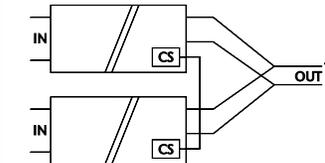

Parallel / redundant operation for DC output (for details see page 125/126)

dd decoupling diode

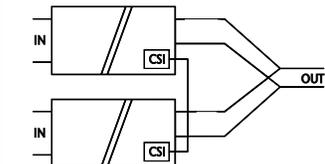

A series diode built into the units output allows paralleling of 2 or more units for redundancy or higher power or battery charging. For control purposes the anode of the diode is also available at the output connector. It cannot be loaded $\geq 0.5A$. The sense signal is taken partially from the anode and partially from the load/cathode of the decoupling diode. This guarantees starting and operating under all conditions, but it also effects the regulation accuracy of 2%. In this way it gives a load sharing of 15-30% between the paralleled units.

**cs** active current sharing

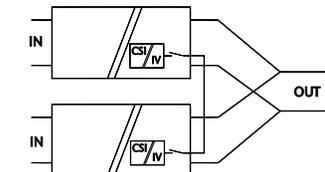

An additional control circuit provides active current sharing via an interconnecting wire between converters that operate in parallel. The output lines of the converters have to be in "star point" connection.

**csi** current sharing interrupt ("cs" included)

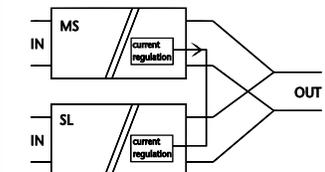

"csi" will effect the removal of the "cs" signal from the load voltage common connection. Should there be an instance where a unit is not supplying the load, then the effect of its current sharing signal is removed, and the load voltage is unaffected by this condition. In terms of calibration the same criteria follow as for parallel operation.

**icsi** current sharing interrupt ("csi" included), galvanically isolated

The inclusion of "icsi" (current sharing interrupt) and the galvanic isolation is the optimum set up for systems with high power or high currents, were the voltage drop on the power wiring could influence the cs signal.

**ma** master / slave operation (available for series 6xxx)

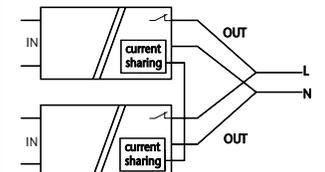

Master / Slave interface permits the parallel function of identical modules to increase the output power capacity, shared by current control without any dynamic reduction in performance.

Parallel / redundant operation for AC output

red inverter parallel operation: for series IT5xxx

For redundant operation or for increased output power, two inverters of the IT5xxx series can be switched together. If one inverter fails, the internal contactor will be switched off and the output power of one inverter is still available.

General information

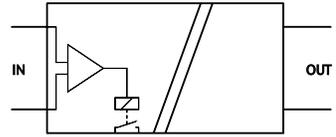

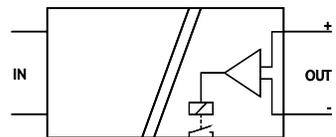

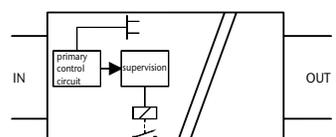

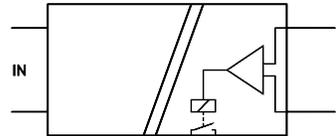

The number of options per module may be restricted due to limitation of space inside the module or due to a limited number of connector pins. Potentiometers or interface cards may be supplied separately for installation outside of the module.

Inhibit	
h1	inhibit by external closing contact, signal referred to input
<p>The operation of the unit is inhibited when a voltage signal is applied in reference to the negative line of the input. This can also be used in combination with a thermal trip, which shuts the unit down.</p>	
h2	inhibit by voltage signal, signal referred to output
<p>Operation of the unit is inhibited if a voltage signal (5V / 10mA) is applied in reference to the negative line of the output.</p>	
h3	inhibit by closing contact, signal referred to output
<p>The operation of the unit is inhibited when a voltage signal is applied in reference to the negative line of the output. This can also be used in combination with a thermal trip, which shuts the unit down. Please note: For inverters, h3 is the only option.</p>	

Automatic reduction of current limiting	
rco	reducing current limiting at increased temperatures
<p>A circuit reduces the current limiting level at higher temperatures (to be specified).</p> <p>Please note: Option is available for series 48xx with ZVS topology and for high power converter modules (see page 49).</p>	

DC output protection	
rd	reverse polarity protection for DC output
<p>by reverse diode with external fuse</p>	

Signals

pr	input voltage supervision (power ok) incl. relay contacts A logic signal is given if the input voltage (AC or DC) drops below the specified limit. In AC input models the rectified input voltage is sensed so that a power fail alarm can be avoided if at light load mains power returns before the input capacitors are substantially discharged. A relay contact is provided for failure indication.	
dr	output voltage supervision (DC ok) incl. relay contacts A logic signal is given if the output voltage is below the specified limit. A relay contact is provided for failure indication. DC ok level: 5V output: 4,75V all other voltages: 90% of adjusted voltage	
cf	charger / converter fail supervision incl. relay contacts A logic signal is given if the input voltage, the auxiliary voltage of the primary side and the current of the primary side exceed or go below a specified range. A relay contact is provided for failure indication.	
ac	AC ok for inverter including relay contacts A logic signal is given if the output voltage of an inverter is below the specified limit. A relay contact is provided for failure indication.	

General information

The number of options per module may be restricted due to limitation of space inside the module or due to a limited number of connector pins. Potentiometers or interface cards may be supplied separately for installation outside of the module.

Programming

Converter Programming	
programming of output voltage from 0 to 100 %	
eu1	by external signal, 0 – 10V
eu2	by external signal, 4 – 20mA
eu3	by 270° potentiometer
eu4	by 10 turn potentiometer
programming of output current from 0 to 100 %	
ei1	by external signal, 0 – 10V
ei2	by external signal, 4 – 20mA
ei3	by 270° potentiometer
ei4	by 10 turn potentiometer
iso	isolating amplifier for programming
	Programming signal is galvanically isolated from any potentials of the power supply.
programming via	
rs	RS232 (external)
can	CAN Bus (external)

Charger Programming	
temperature features	
tc	temperature compensated charging voltage (sensor not included)
ts1	temperature sensor not interchangeable due to fixed resistor values
ts2	temperature sensor interchangeable, IC controlled
charging characteristics	
ch1	External card: automatic and manual selection of charging characteristic (float/ equalized boost charge) with timer (delayed return to normal operation), including aux. supply and options "tc" and "ts1"
ch2	External card: consisting of option "ch1" plus: Battery current limitation & battery shunt
ch3	External card: consisting of option "ch2" plus: CAN-Bus-interface & programmable parameters

Monitoring

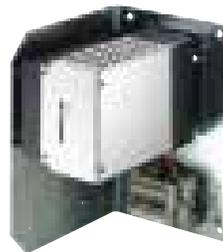

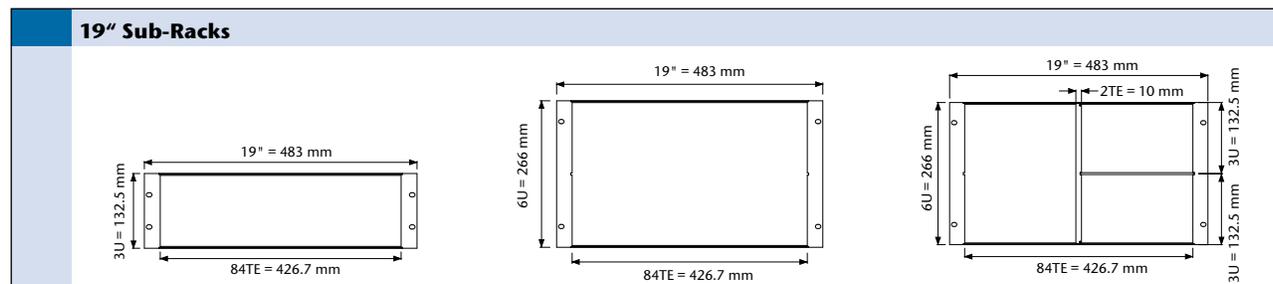

Converter / Charger Monitoring	
monitoring of output voltage from 0 to 100%	
mu1	by external signal, 0 – 10V
mu2	by external signal, 4 – 20mA
monitoring of output current from 0 to 100%	
mi1	by external signal, 0 – 10V
mi2	by external signal, 4 – 20mA
iso	isolating amplifier for monitoring
	Monitoring signal is galvanically isolated from any potentials of the power supply.
monitoring via	
rs	RS232 (external)
can	CAN Bus (external)

Mechanics

As standard, all of the modules are designed and manufactured for insertion into 19" sub-racks. Higher power modules are already constructed in 19" format.

Optionally, 19" sub-racks are available and can be configured as 3U or 6U allowing any mix of units and can be upgraded in accordance to the customers' requirements, e.g.

- mating connectors wired to a terminal block
- fuses or circuit breakers
- hot swappable configuration upon request
- analog or digital meters
- switches
- fans
- filters
- decoupling diodes
- provisions for keying the modules to ensure module / slot designation

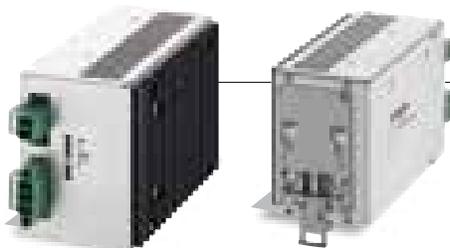

w wall mount

Modules, which have the wall mount option, are typically fixed to a structure or within a cabinet. Depending on the size of the module, this may be done with a flat or angled plate (see photo). The load connections are typically through a terminal block. Should the application not require a pluggable module / rack solution, wall mounting presents an alternative option for the customer to choose from.

cha chassis mount

Module is designed for installation to a structure or within a cabinet. Screw type mating connectors are supplied with the module. Due to the limited number of connector pins this option is not available for modules with dual AC input. Option is available for currents up to 60Amps.

din DIN rail mount

Module is designed for DIN rail mounting to a structure or within a cabinet. Screw type mating connectors are supplied with the module. Due to the limited number of connector pins this option is not available for modules with dual AC input. Option is available for currents up to 60Amps.

Environment

t	tropical protection
	The unit is given additional protection by a heavy coat of varnish on the printed circuit board(s) and on components to achieve 99% RH, non condensing.
c	extended temperature range
	The circuit is designed and tested for operation at an ambient temperature as low as -40°C .
ms	increased mechanical strength
	Screws are secured with Loctite and heavy components are fastened by ties and / or glue. Modules with the "ms" are build acc. to EN 61373 regarding shock and vibration.

Control & Monitoring

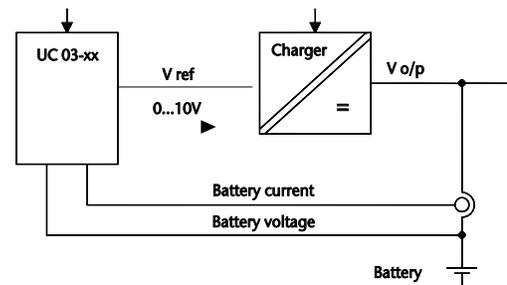

**TC 01 Control function**

analog or micro processor controlled supervision:

- input voltage
- output voltage
- battery circuit
- ground insulation failure
- over temperature

UC 03 Enhanced controller function

The "UC 03" unit controls and supervises the optimum charging of a battery, up to an entire UPS system. A battery charging in a basic way, with a switch mode AC/DC or DC/DC Charger, is shown in the following figure.

The charger output voltage is regulated inside the charger according to the input "Vref" signal. The gain factor between Vref and Vo/p is defined in the Specification of the Charger. The charger current limitation is also a function of the charger. The reference values, limitations and monitoring levels for charging a battery (ies) are configurable in the UC 03. The charging of the battery occurs according to the current / voltage characteristics, i.e. the battery is loaded in current limitation, until the appropriate voltage is reached. The following working conditions are processed by the UC 03:

a.

Float Charge conforms to the recommended permanent voltage to hold the battery within a completely charged state.

b.

Equalize or Automatic Boost Charge: To charge the battery after a partial or deep discharge as quickly as possible, an increased voltage is provided. This mode is activated automatically via different functions, or manually via the front panel button.

c.

Manual Boost Charge: independently adjustable voltage, to regenerate an aged battery. In all three working conditions the maximum battery charge current is limited.

The following technical notes contain important information about various operating possibilities and circuitries as well as instructions that should be followed during installation etc. For further information please contact the SCHAEFER Team.

Parallel / Redundant System	I25
AC or DC input	I27
DC output	I28
AC output	I29
DC output voltage stabilization	I30
Mounting & Installation	I31
Connectors	I32
Basic Topologies	I33

Parallel / Redundant System

<p>Parallel operation</p> <p>Single output modules of the same voltage / power rating can operate in parallel under specific conditions. The output voltage can be carefully adjusted to be near identical. When there is sufficient loading on the combined output, all units will be active and supply the load. The load demand must be significant enough for the multiple units to deliver output current.</p>	
<p>Redundant operation</p> <p>The inclusion of the option “dd” (decoupling diode) on the output of the units will permit parallel operation, where the inability to provide output from one unit will not have a negative effect on the load provision. The decoupling diode will also result in a load regulation value, which, as a percentage of the output voltage, will be unit / output dependent. In terms of calibration the same criteria follow as for parallel operation.</p>	

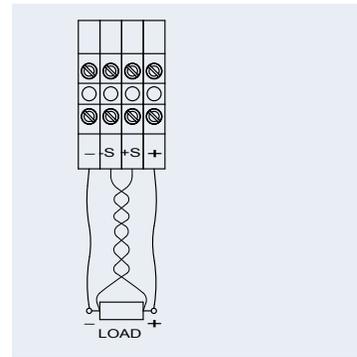

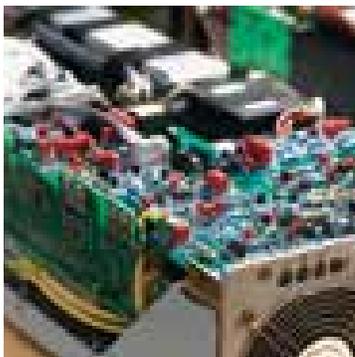

<p>Balanced current operation</p> <p>The inclusion of the option “cs” (current sharing) allows for parallel operation with a significant degree of current balancing. The communication between the units allows for a voltage setting correction, which in turn shall equate to an automatic current sharing (balancing) on the outputs. The tolerance of such balancing is module dependent. In terms of calibration the same criteria follow as for parallel operation.</p>	
<p>Redundant balanced operation</p> <p>The inclusion of both, the “cs” and “dd” option results in an optimized balanced current provision while being de-coupled from each other. A connected module, who is not supplying an output voltage, will influence the load voltage. The voltage may be reduced by up to 7%. In terms of calibration the same criteria follow as for parallel operation.</p>	
<p>Fault tolerant operation</p> <p>The inclusion of “csi” (current sharing interrupt), “cs” and “dd” is the optimum set up for a fault tolerant application. “csi” will effect the removal of the “cs” signal from the load voltage common connection. Should there be an instance where a unit is not supplying the load, then the effect of its current sharing signal is removed, and the load voltage is unaffected by this condition. In terms of calibration the same criteria follow as for parallel operation.</p>	

AC or DC input

Inrush current	
When the module is connected to the input power, the primary capacitors will be charged by a high current pulse. The magnitude of this pulse depends mainly on the input supply system. With a thermistor (temperature dependent resistor) in series with the input, this current pulse can be reduced, as the thermistor has a relatively high value of resistance as long as it is cold. This resistance becomes very low as the thermistor heats up. If the input power is interrupted for a	short period of time not allowing the thermistor to cool down, and the primary capacitors are discharged, the current limitation function of the thermistor will not be effective. The thermistor is standard on mains input models up to 45 Amps input current. For higher input current there are two further alternatives available: Schaefer PFC or an electronic current limitation.
Power factor correction (PFC)	
Power supplies draw line current in pulses from the input supply. Should it be required, a PFC will integrate these pulses to be both, effectively sinusoidal in shape, and in phase with	the AC input supply. The result of this integration, be it active or passive, is the reduction of the harmonic distortion and allows a more effective loading of the input source.
Spike suppression	
High input voltage spikes generated in the supply system that could disturb operation of the unit or cause damage will be	absorbed by a varistor across the input lines.
Input under and over voltage turn off	
The input voltage range of the unit is defined as the voltage limits at which it will operate. Should the input be reduced to a specific voltage, the unit will turn off by switching off the power circuit. The same applies to an increase in the input	voltage. Once a preset value is reached then the power circuit will be switched off. It must be considered that the switching off of the power circuit does not mean a removal of the input circuit from the power supply.
Thermal shutdown with auto restart	
The higher power Schaefer modules are fitted with a thermal shutdown. In the event of a temperature rise above a preset value, the unit will turn off. This safety feature will then	remain active until the point of temperature measurement has reduced significantly. The time duration for this to be reached is dependent upon the environment and level of cooling.
Temperature derated load	
It is the responsibility of the client to reduce the loading of the Schaefer product with respect to the temperature (derated load: 2.5%/°C from +55°C operating temperature). The	maximum operating temperature of +75 °C must lead to the unit being switched off.
Efficiency	
The optimum efficiency is obtained through a high input voltage measured against a high output voltage at maximum	power rating.

DC output

Soft start																											
The application of the input power permits the unit to generate a secondary output. The switching on of the primary power circuit is controlled and gradually increased to allow	a controlled charging of the secondary capacitors. The time duration for the secondary capacitors to be charged is defined as the soft start.																										
No load operation																											
Single output converters require no minimum load for operation within tolerance. Multi output converters require	the main output be loaded. Semi-regulated auxiliary outputs may also require a minimum load to be applied.																										
Short circuit protection																											
The main output of a converter will be immune against a momentary or continuous short circuit. The secondary current limitation will not permit the sustained output current to be higher than the calibrated setting, and it will actively reduce the output voltage in accordance to the overload. The	removal of the overload / short circuit will result in the output voltage being increased to the calibrated value. Regulated auxiliary outputs will also reduce the output voltage / current in accordance to their overloading. The characteristic may vary according to the circuit employed.																										
Over voltage protection (OVP)																											
The main output voltage is measured, either internally or through sense leads. This measured value is compared against a calibrated value. When the calibrated value has been reached, this circuit turns off the primary power circuit. Once the measured value has reduced below the calibrated	value, the primary power circuit is permitted, once again, to be activated. The high power units have an additional feature, which will shut down the primary power circuit after a continued OVP operation. The input power must be re-cycled in order to remove the unit from shut down.																										
<table border="1"> <tr> <td>voltage adjustment [V]</td> <td>5</td> <td>9</td> <td>12</td> <td>15</td> <td>24</td> <td>28</td> <td>48</td> <td>60</td> <td>110</td> <td>200</td> <td>220</td> <td>400</td> </tr> <tr> <td>Over voltage protection [V]</td> <td>6.5</td> <td>12</td> <td>15</td> <td>18</td> <td>30</td> <td>35</td> <td>60</td> <td>70</td> <td>140</td> <td>220</td> <td>280</td> <td>440</td> </tr> </table>		voltage adjustment [V]	5	9	12	15	24	28	48	60	110	200	220	400	Over voltage protection [V]	6.5	12	15	18	30	35	60	70	140	220	280	440

Over voltage protection [V]	6.5	12	15	18	30	35	60	70	140	220	280	440															
Sense leads																											
Through the use of sense leads, an output voltage may be regulated to a point outside of the unit. The sense leads should be connected to the power connection at the point of load in the correct polarity. There should be a non-interruptible connection between sense and load points. Interruption may lead to damage or the activation of the OVP circuit. The units, which have sense leads, have the ability to regulate to a higher voltage at the output connection. This increase is largely dependent upon the unit. The details may be found in the respective unit specification. Parallel operation with sense leads allows a common point for the units to regulate their	voltages to. Units whose output voltage has been calibrated to be near identical will now be able to supply a common load. De-coupled outputs will be sensed both, before and after the decoupling diodes, which in turn will lead to an output voltage regulation, specific to the load and unit. Sense leads are typically employed with a decoupled output voltage of less than 40VDC. The current sharing option will effectively override the sense lead output voltage setting, but the point at which the output voltage is regulated, will be the point of sense lead connection.																										

AC output

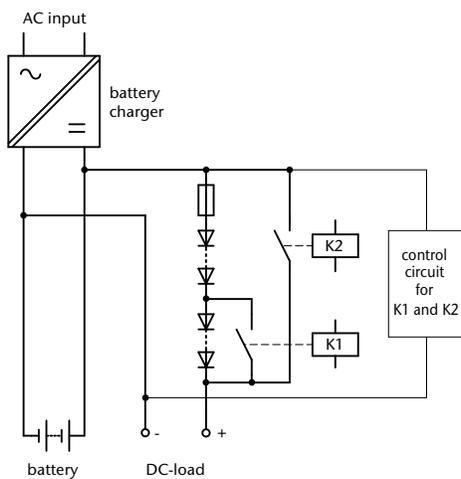

Soft start	
The application of the input power permits the unit to generate an AC output. The output power increases linearly until it reaches its calibrated value. This delay from initial	output generation until the nominal value is defined as the soft start.
No load operation	
Inverters require no minimum load for operation within tolerance.	
Short circuit protection	
The inverter current limitation circuit provides a protection against an external short circuit. Due to the need for crest factor and pulse power requirement in many applications, the current limitation permits twice the nominal output current to be extracted for up to 1 second. The current limitation	will then be reduced to typically 105% of the nominal value. Should the overloading persist, and the output voltage reduce to less than 20% of nominal, then the unit will perceive an overload condition and turn off. Recycling the input voltage will remove this latched off condition.
Crest factor	
The ability of an inverter to deliver an inrush current to a load is related to the crest factor. The crest factor is the ratio	between the nominal and the peak current.
Over voltage protection (OVP)	
The high power units have this feature. It will shut down the primary power circuit after a continued OVP operation. The input power must be re-cycled in order to remove the unit from shut down. The output voltage is measured internally. This measured value is compared against a reference value.	When the reference value has been reached, this circuit turns off the power circuit. Once the measured value has reduced below the reference value the power circuit is once again permitted to be activated.
Sense leads	
Sense leads are internally connected in all standard configurations.	
Harmonic distortion	
The generated inverter output is designed to follow a true sine wave signal. Deviation from this sine wave is measured as distortion. The level of deviation is defined as	harmonic distortion. The total harmonic distortion THD is the relationship between the harmonic and fundamental waveforms.
Surge power	
The AC output may facilitate the output load through its ability to provide more then the nominal current for up to 1	second.
Power factor	
The AC output may facilitate complex or other loads, through its ability to provide a phase shifted output current at nominal power rating. This is once again due to the ability to provide	more than the nominal output current for a limited period of time.

DC output voltage stabilization

The output voltage of a battery charger with parallel connected batteries varies substantially with the charging condition of the battery. For many applications, however, the load circuit requires a more stabilized voltage which can be accomplished by:

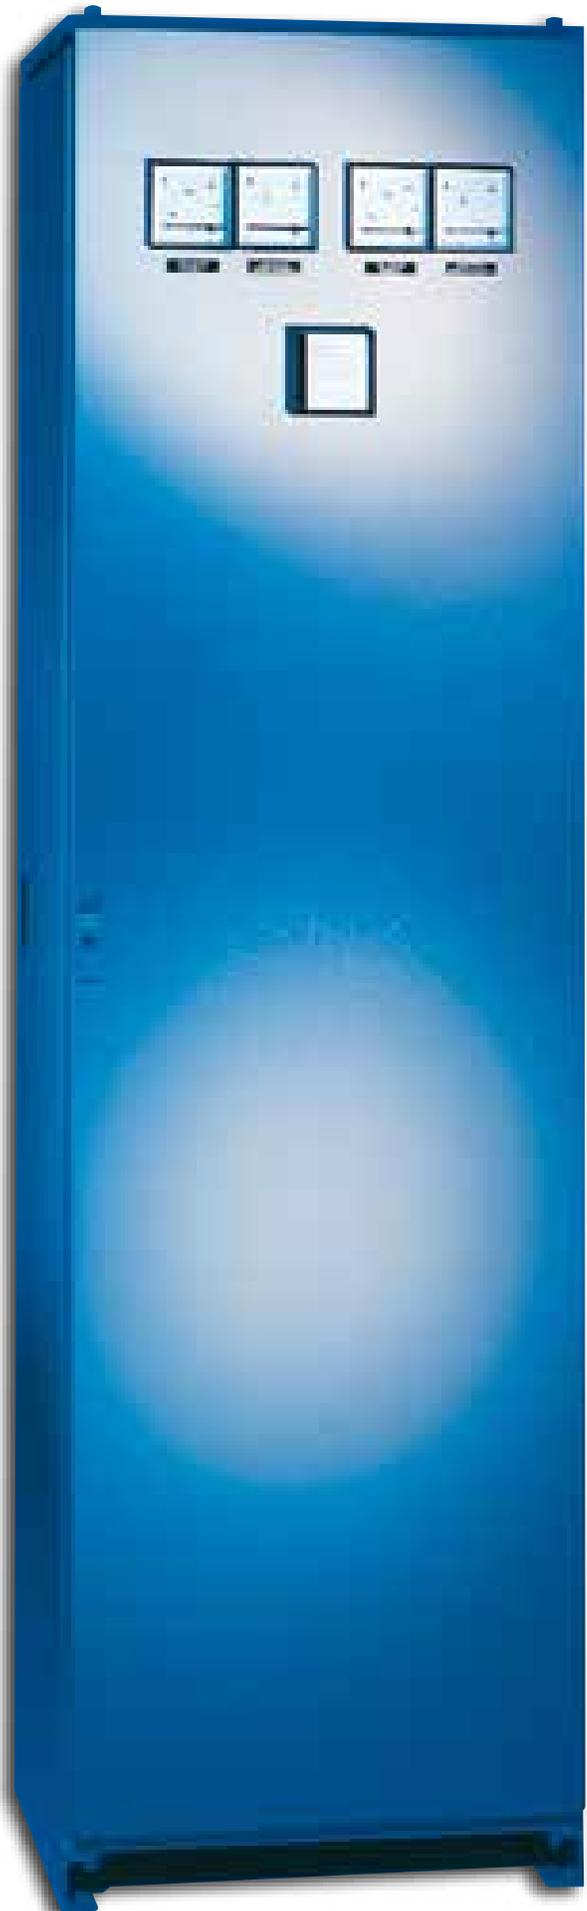

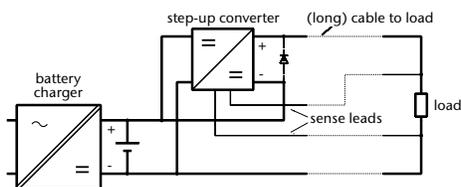

Voltage dropping diodes

being interconnected between battery and load, reduce the voltage to a value suitable for the load. They are short-circuited by one or more contactors only if a partial reduction or no voltage reduction is required. A control circuit senses the battery voltage and energizes the contactors. Voltage dropping diodes cause substantial power losses as the excess voltage is absorbed by the diodes. However, due to simplicity, this method is frequently used, especially if the voltage reduction is needed only during the short periods of high-rate charging.

Switchmode step-up converters

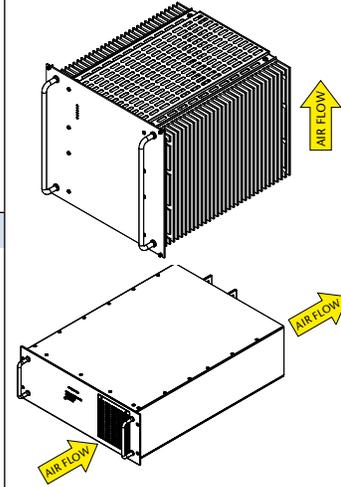

are DC/DC converters supplied from the battery with the output connected in series to the battery. They present a very economical solution as they only add voltage when the battery is discharged. *Details see page 47/ 83.*

Mounting

Air flow

Airflow to the power supply is preferred to be filtered, below 55°C, an airflow resistivity (pressure drop) of below 20kPa and is required to comply with the EN60950 pollution category II. Diffused thermal energy is required to be exhausted and displaced by air as detailed above. Thermal management is required where the air provided to a power supply complies with the power supply's design parameters. The use of fans requires the increase airflow rate to a minimum of 120m³/h (corresponding to 70cfm). The airflow resistivity and respective pressure drop should be considered when the fan is required.

Direction of air flow

Typically, Schaefer Modules and systems are cooled through air supply entering below and exiting above, with the exception of models of series C/B 5100, 5200, 5300, 5400, 6400 and 6600 whose airflow is from front to back.

Custom design also offers lateral cooling. Such details are however, project specific.

Cabinet

To enhance a module/system, a cabinet may be employed.

- This may be required to fulfil the increased IP/NEMA rating, due to a negative effect of the environment on the solution.
- Specifically, in an unclean, saturated, corrosive or otherwise aggressive air quality it may be required to employ a cabinet in combination with features such as a hermetically sealed enclosure and air exchange.
- The enclosure must be capable of sustaining the weight of the modules, specifically if module support rails are used.
- Stationary cabinets should be fastened to the ground.
- The centre of gravity must be as low as possible with portable systems.

Transportation of module

The grips/ears on the front of the modules are to assist in module insertion into a sub-rack, and NOT for supporting the weight of the module.

Wall mount/chassis mount

Modules with a mounting plate or angle are designed for integration into the host equipment. They are not for employment outside of an enclosure.

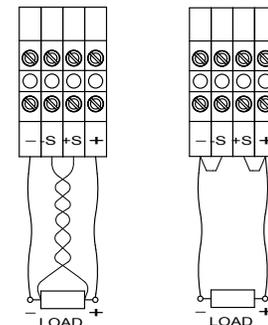

Installation

Input fuse

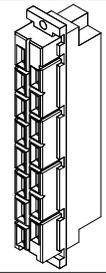

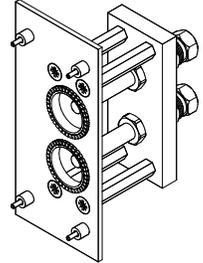

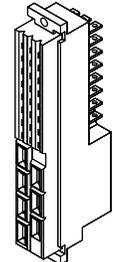

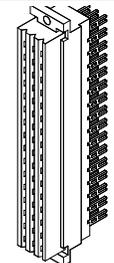

An input fuse, internal or external, should be selected with a slow burn characteristic.

Sense leads

- The distance between the load connection and the module/system may result in a voltage drop between the output and the load connection. To compensate for a limited value of such a voltage drop, sense leads can be connected to the load using care in regards to polarity. The sense leads determine the point to which the voltage regulates. As the sense leads carry very low current, they are susceptible to noise pick up. Therefore, it is recommended that they are intertwined and if necessary shielded.
- When the remote sense facility is not used, sense links must be made at the output terminals. If the sense links are left open, the output voltage may rise causing the OVP circuit to be activated.

Connectors

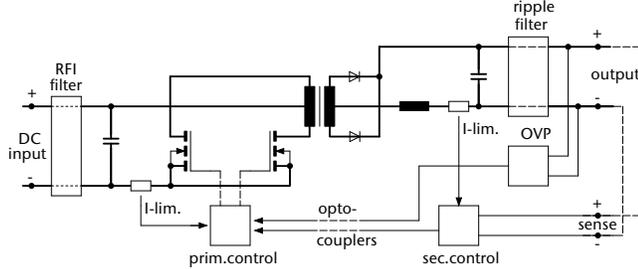

<p>H15 Female Connector</p> <p>Number of contacts: 15 Contacts: Fastons or screw terminals Operating current at +20 °C: 15A Operating temperature: -55 to +125 °C Test voltage (contact to contact): 3100V_{rms} Test voltage (contact to ground): 3100V_{rms} Contact resistance: 8mΩ Performance according to: IEC 60603-2 / DIN 41612</p>		
<p>High Current Female Connector</p> <p>Number of contacts: 2 Contacts: Bolts with 8 mm diameter for terminal lugs M8 Operating current at +20 °C: 170A Operating temperature: -55 to +125 °C Test voltage (contact to contact): 500V_{rms} Test voltage (contact to ground): 2500V_{rms} Contact resistance: 0.06mΩ Dimensions (H x W x D): 118 x 35 x 85 mm Performance according to: IEC 60603-2 / DIN 41612</p>		
<p>F24H7 Female Connector</p> <p>Number of contacts: 24 / 7 Contacts: solder pins / fastons Operating current at +20 °C: 6 / 15 A Operating temperature: -55 to +125 °C Test voltage (contact to contact): 1550 / 3100 Vrms Test voltage (contact to ground): 2500 / 3100 Vrms Contact resistance: 15 / 8 mΩ Performance according to: IEC 60603-2 / DIN 41612</p>		
<p>F48 Female Connector</p> <p>Number of contacts: 48 Contacts: solder pins Operating current at +20 °C: 6 A Operating temperature: -55 to +125 °C Test voltage (contact to contact): 1550 V_{rms} Test voltage (contact to ground): 2500 V_{rms} Contact resistance: 15 mΩ Performance according to: IEC 60603-2 / DIN 41612</p>		

There are various circuit topologies and the selection depends on the requirements, such as low or high input voltage, low or high output voltage, single or multi output, power rating. The following circuits present our common concepts of power conversion.

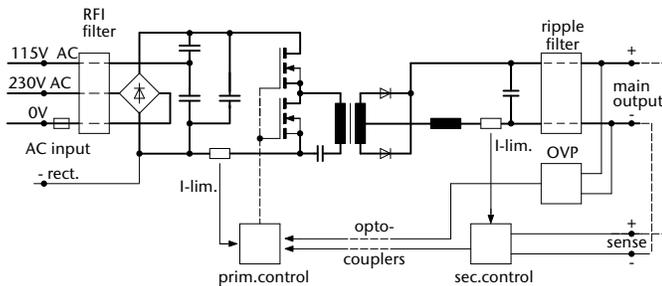

Push Pull Converter

The push pull converter is often used for applications with low input voltage. The switching transistors are alternately conducting with variable pulse-width. At the secondary side, after rectification and filtering, the output voltage is sensed and compared with a reference. The error signal controls via an opto-coupler the primary circuit.

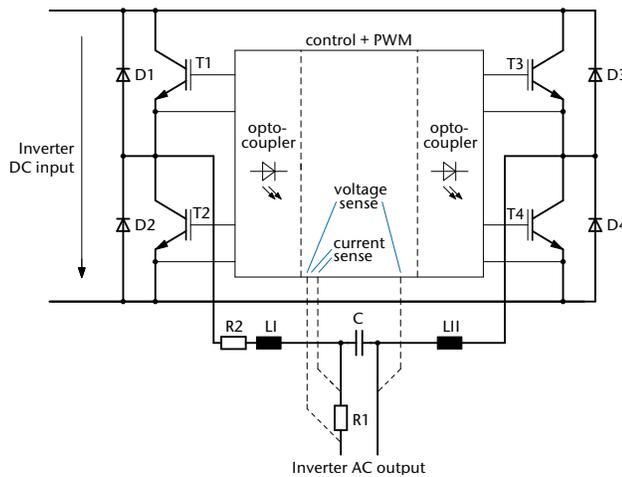

Half Bridge Converter

The following circuit shows, as an example, a converter with dual AC input in a half bridge connection. With the input voltage supplied to the 230V terminal, the rectifier circuit is a standard bridge connection; supplied to the 115V terminal the rectifier circuit functions as a voltage doubler circuit.

DC/AC Inverter

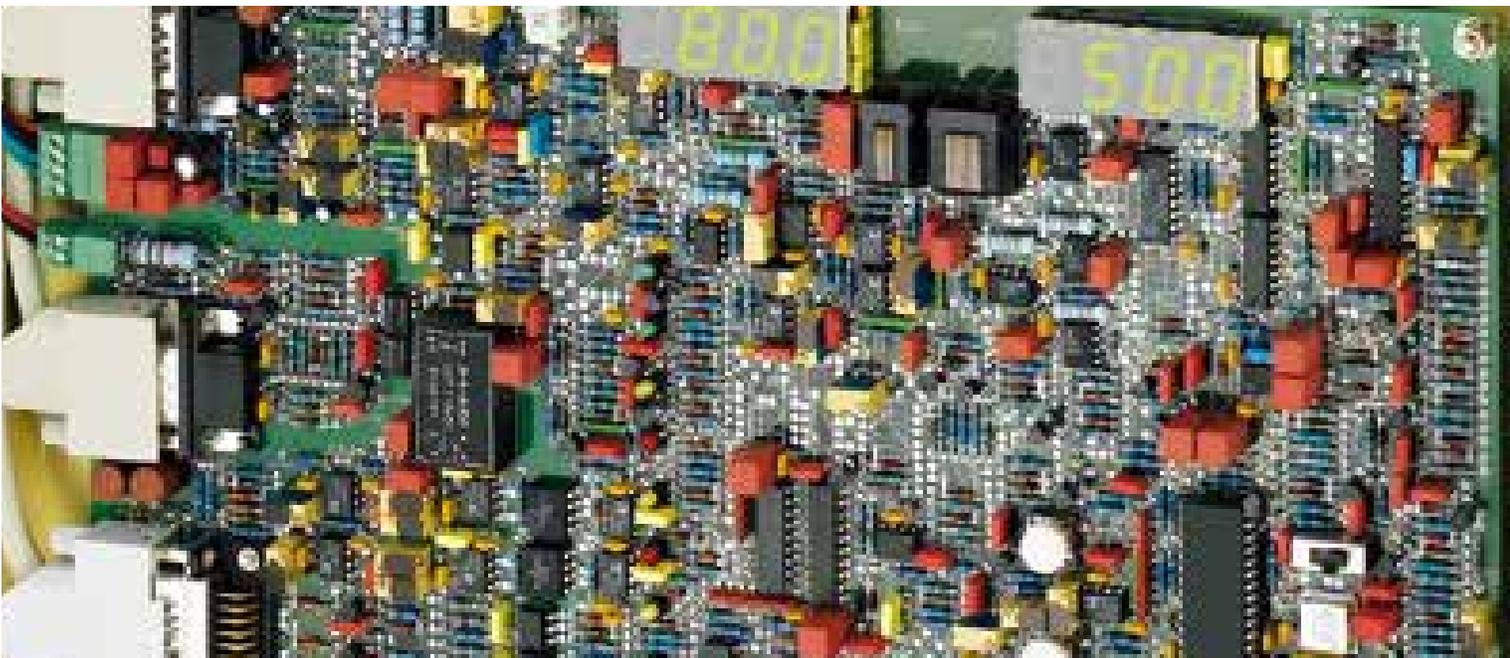

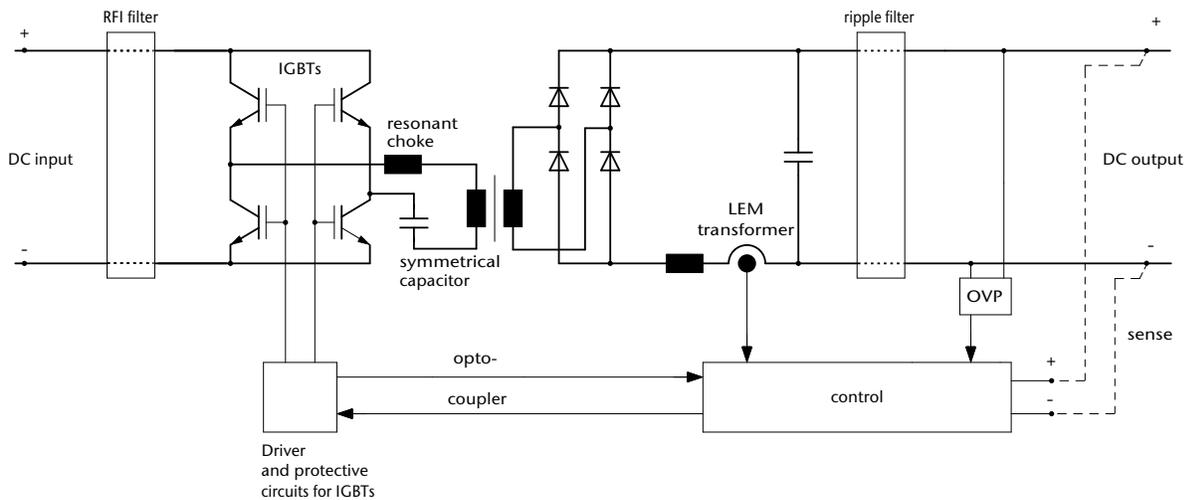

The diagram beside shows the circuit of an inverter. The DC input voltage is transformed by the power transistors T1-T4 with the parallel connected inverse diodes D1-D4 in a pulse-width modulated square wave voltage. The choke with the windings LI and LII integrates this voltage, and at the capacitor C a sinusoidal output voltage is available. The power transistors are controlled via opto-coupler in such a way that not both transistors of one branch are conducting at the same time. The output voltage is sensed and compared with a reference signal generating the firing pulses for the power transistors. The output current is measured via shunt R1 and limited through the control circuit. Isolation between input and output and voltage transformation can either be provided by a converter connected to the input of an inverter or by a transformer connected to the output of an inverter.

Full Bridge Converter with Zero Voltage Switching (ZVS)

For the higher power modules presented from page 46 to 67 the primary circuit is performed as a full bridge connection with four switching transistors (IGBTs) being controlled by the driver and protective circuits. The special mode of driving the IGBTs in conjunction with the resonant choke and the symmetrical capacitor allows for "zero voltage switching" which improves the efficiency and reduces the switching noise. The input can be designed for both, DC or AC. At the secondary side of the transformer the voltage is rectified and filtered. Then the output voltage is sensed and compared with a reference, and

the error signal controls via opto-coupler the switching transistors on the primary side. For over voltage protection the OVP circuit senses the output voltage and turns off the switching transistors if a certain level is reached. The circuit automatically returns to operation but is repeatedly switched off and turned on again if the over voltage condition is still present. If the unit does not return to normal operation within a short period of time, it will then be switched off. For current limiting the signal sensed by the LEM transformer starts to reduce the output voltage if the current exceeds a certain limit.

The distinction in the market of power supplies is achieved by being customer orientated, the unique variety of products available and the high level of flexibility to customer specific requirements as well as the modification of standard equipment for small and large quantities.

Customization

Immediate proximity also generates the free flowing information path, which is the production and development areas, along with the testing and customer support areas being all under the same roof. This enhances the SCHAEFER Teams ability to react to exacting demands with ease. Fruits of this labour are to be seen throughout the World, in a variety of fields such as:

- Rail & Automotive Industry
- Power Generation Plants
- Oil & Gas Industry
- Chemical Industry
- Industrial Automation
- Military Industry
- Building Security
- Integrated Airport Solutions

Be they on shore or off shore, stationary or mobile, land, air or marine based. A system component or complete system, environmentally Hazardous area 1, corrosive or simply Industrial, there is a SCHAEFER Power Solution to fit the parameters.

Welcoming the challenge, the SCHAEFER Team offers the highest level of engineering design and manufacturing.

40kW On-board Power Supply System

- Multi input / Multi output system
- Hermetically sealed enclosure
- Controlled air management
- Battery charger & DC Bus supply
- Challenging environmental specifications
- Engineered for high degree of shock & vibration
- Self-protecting, autonomous assessment of thermal and electrical parameters

8kVA Rolling Stock Mounted Inverter, IP66

- Client specific interface connection
- Anchored to the RAIL Car floor
- 600mm × 600mm foot print
- Impervious to both impulses and spikes across the input, this module delivers the full output range with a crest factor of 3, up to +75°C environmental temperature
- Full power ability, across a phase shifted load, capacitive & inductive load tolerant of $\pm 0.7\cos\phi$

300kW ultra fast charging station for E-Busses

- Modular and expandable power capability
- N+1 redundancy concept fully redundant and fault tolerant
- Easy system expandability up to 1MW by adding additional fully wired 100kW enclosures
- Output voltages available up to 1000V
- Control and adjustability of electrical parameters
- Additional customised options CAN/ Modbus Interface

Coolant System Control for Reactor

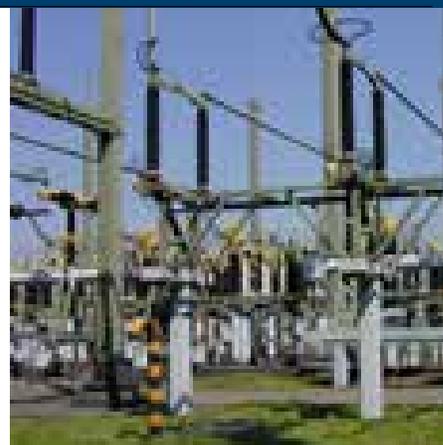

- KTA 3507 certified
- Integrated switch mode Power Supply
- Reactor Core temperature evaluation
- High level of reliability, redundant fault tolerant capability
- 19" designed Rack mechanical solution
- Enhanced mechanical design
- Programmable output parameters through Client Interface

Power Supply Modules for Substations

- Fault tolerant power configuration
- Automated interrupt free by-pass operation
- Stabilized load feed
- Expandable to multiple redundant design
- Hot-pluggable
- Multiple mechanical solutions and styles

N+2 UPS System

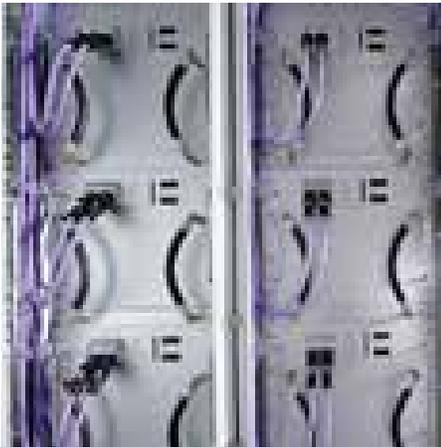

- Configured both dual redundant & fault tolerant
- Supplied from multiple independent DC and an AC source
- Both automatically and manually operational by-pass system
- Integrated & isolated AC by-pass
- The indication panel reflects the operational status, while multiple stage monitoring is both locally and remotely communicated.

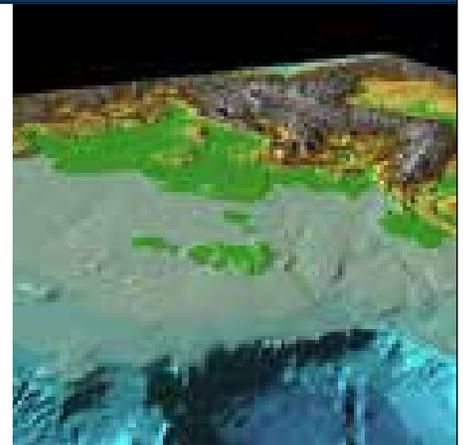

Subsea Power Supply

- Module based on a C3700 standard unit
- Extreme Environmental Challenges
- Wide range AC input
- Robust heat sink design to integrate into the titanium pipe / tube
- Enhanced mechanical integration
- Over-temperature alarm
- The unit is given additional protection by heavy conformal coating on the printed circuit board and on the components.

360kW expandable power supply system

- Mineral exploration on vessel:
- Assisting the oil industries in the search of oil reserves offshore via electromagnetic streamer process
- Liquid cooled current source up to 2500A with high dynamic regulation properties
- Modular, N+1 redundant concept via 30kW single modules with Master/ Slave configuration

Power Supply for Off-shore Oil & Gas Industry

- 15kW liquid cooled power supply system
- Dimensions: 5U × 19" × 600mm deep solution (H x W x D)
- Redundant fault tolerant capability
- High efficiency through ZVS topology
- Assisting the industry in the search for mineral resources

On-board Military UPS

- Integrated Inverter, Static Switch and Battery Charger
- Dimensions: 6U × 19" × 500mm deep solution (H x W x D)
- Robust and reliable design
- Digital voltmeter display for DC input (battery voltage) on front plate
- Push button for "Latch Reset"
- Common alarm with relay contact
- Digital voltmeter display for DC input (battery voltage) on front plate

On-board 3D Radar Power Supply

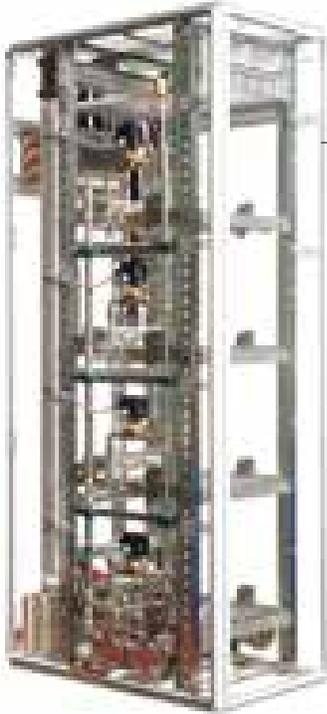

- AC/DC converter with fan cooling
- High level of reliability, Redundant fault tolerant capability
- Environmental adapted to 97% non condensing humidity
- Power Factor correction for three-phase input minimizing the load requirement of generator
- Client specific mechanical & electrical design with special heat sinks

Integrated combined solution

- 5kW Modules ensuring a high power density
- Flexible orientation
- Capable of populating a 5U RACK with three units
- Capable of populating a 3U RACK with two units
- Engineered for high degree of shock & vibration

N+1 DC UPS System

- Configured as a redundant & fault tolerant solution
- Supplied from multiple independent AC sources
- Both automatically and manually operational output characteristic
- Compliant with exacting environmental standards to ensure a highly reliable load power supply for critical applications

7kW Power Supply for Security Checkpoints

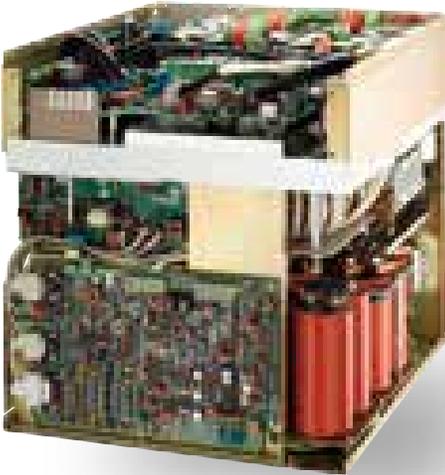

- Airport application
- Wide input voltage range: 208 - 400VAC, 3-phase
- High output voltage: 600VDC
- Cooling via temperature controlled fans
- Industrial grade components
- 4U plug-in module

Worlds largest water fountain at Burj Khalifa, Dubai

- Charging the integral water, light and sound show of the fountain
- Turn-key customised design: UPS systems within a cabinet inclusive battery equipment as well as various SMPS systems
- Supervision and diagnostic software
- CAN/Ethernet interface for control and monitoring of electrical parameters

40kW Liquid Cooled Power Supply

- For semiconductor manufacturing industry
- Highly demanding environment
- Extreme load variations
- Transfer of thermal energy into a fluid for heat exchange re-capture
- Programmable output parameters through Client Interface

DC/DC Converter for Robotics Power Supply

- Wide input voltage range: 450 - 800VDC
- Multi output parameters
- Natural convection
- Remote on / off (inhibit)
- CAN-Bus interface
- High level of reliability, redundant fault tolerant capability

Digital controlled generator for Eroding Steel Rolls

- Electrical Discharge Generator with adjustable power source: 0-30A
- Synchronized output at $U_{out}=300V$ with adjustable frequency in the range of 200Hz to 300KHz
- Pluggable system, installation on water heat sinks via pressure rails
- Communication via EtherCat (PC-generator)

4kW Inverter System for Aircraft Mains Simulation

- Ground equipment for mains simulation on the Eurofighter
- Converter for 400Hz mains simulation
- Output selection, 3-phase AC or 3 individual DC voltages
- Each output is individually programmable via RS232 interface in voltage and frequency
- 400Hz Input Frequency

1kW N+I Tsunami Warning System

- Sub sea power supply
- Input voltage 1200VDC up to 2450VDC (nominal)
- Output voltage required, 380VDC (300 – 400VDC calibration range)
- Galvanic isolation
- High level of reliability

Safety Valve

- For installation in explosive environments (hazardous area 1)
- Allowing the failure of a single power supply, not affecting the controlled output
- The overall power supply unit is housed within a certified Exd enclosure
- An Exe enclosure being attached to the Exd enclosure contains all terminations, operator indications and switches
